## Applicable Motors

### Application

	MOM/MOM-C/MOM-K/MOM-CK
Servomotor	—
Stepping Motor	—
General-Purpose Motor	◎

◎: Excellent ●: Very Good

### Property

	MOM/MOM-C/MOM-K/MOM-CK
Zero Backlash	—
High Torque	◎
High Torsional Rigidity	◎
Allowable Misalignment	●

◎: Excellent ●: Very Good

- Oldham type flexible coupling.
- FCD400 is adopted in the spacer. Suitable for low-speed and high-torque specification.
- High performance grease is applied in the gap between hubs and the spacer in order to prevent sticking.
- Slippage of hubs and a spacer allows large eccentricity and angular to be accepted.
- A projection placed in the spacer (resin pin) allows angular to be effortlessly accepted.
- Long-term maintenance free. The grease accumulated in a grease hole will gradually seep out during operation, thereby maintaining the lubrication property over a long period.

### Application

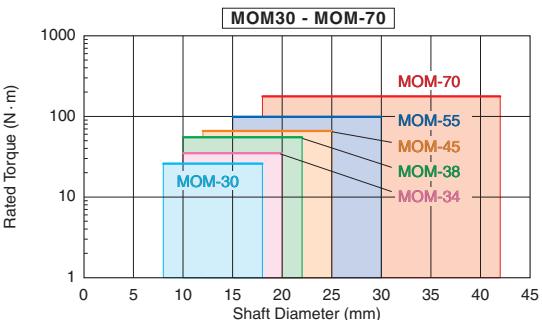

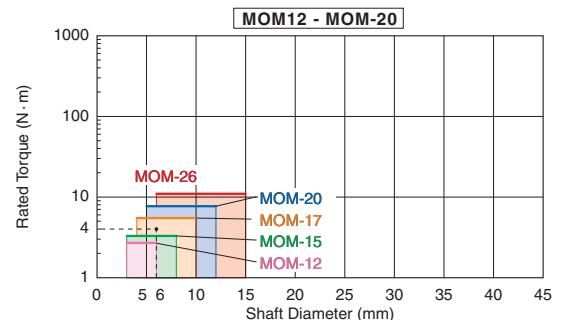

Mixer / Pump / Small power press / Grinder

## Selection

### Selection based on performance

Please use the selection tool on our website ([www.nbk1560.com](http://www.nbk1560.com)).

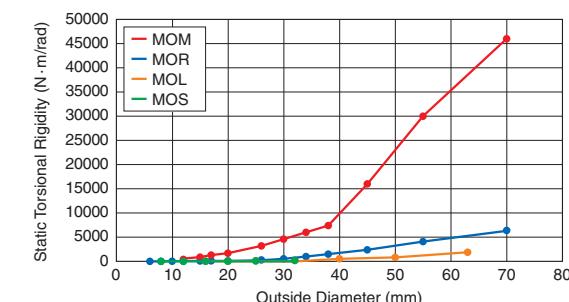

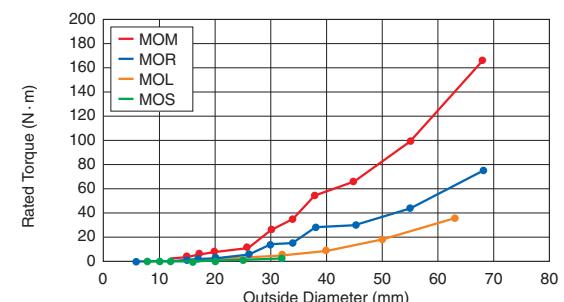

### Selection based on shaft diameter and rated torque

### Selection Example

When under the condition of shaft diameter:  $\phi 6$  and load torque:  $4\text{ N}\cdot\text{m}$ , the selection size of **MOM** is **MOM-17**.

### Comparison of rated torque and torsional rigidity

**MOM**'s torque and torsional rigidity are higher as compared with resin spacer's oldham type coupling **MOR**, **MOL**, **MOS** because of FCD400 spacer.

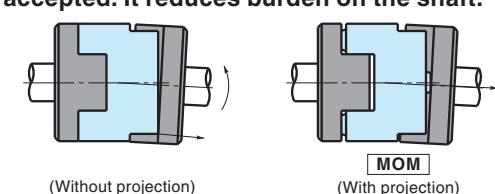

**MOR** ➔ pages 28-29

**MOL**

**MOS**

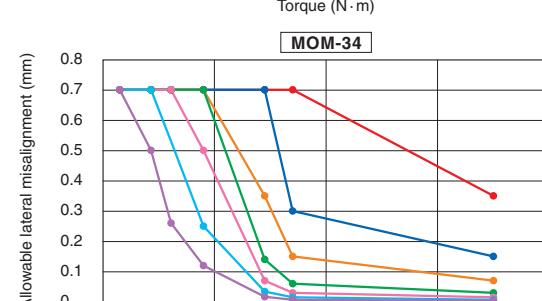

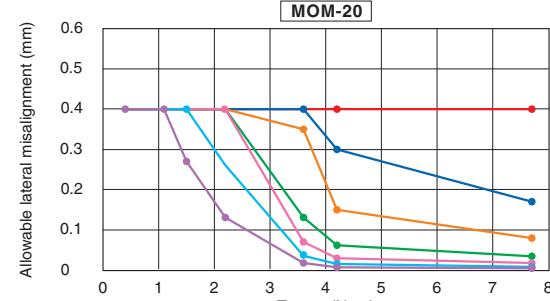

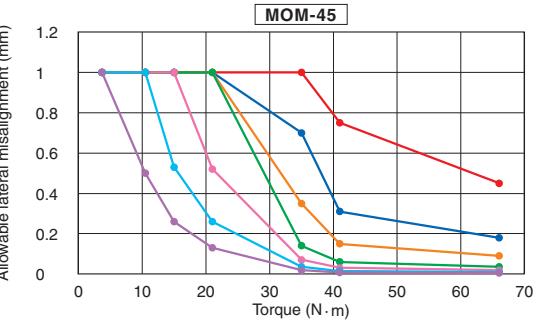

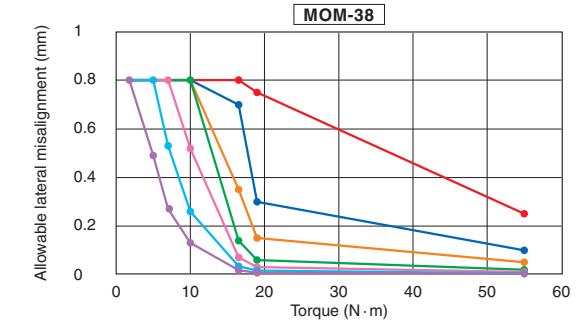

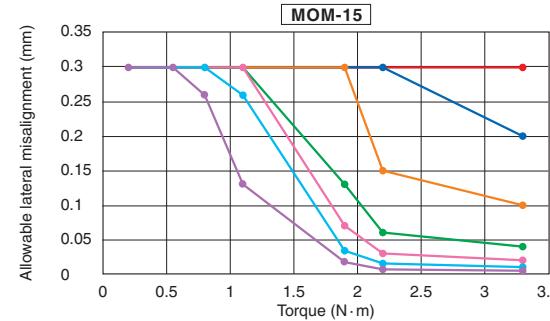

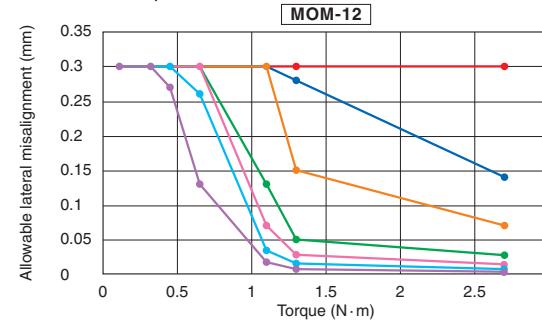

**Spacer's projection structure allows large angular to be effortlessly accepted. It reduces burden on the shaft.**

In the oldham type coupling whose spacer has no projection, the spacer and hubs interfere with each other near outside diameter, so that the allowable angular is small ( $1^\circ - 1.5^\circ$ ) and that the bending moment arises on the shaft. NBK's oldham type coupling easily allows the angular since the projection serves as support. Bending moment does not arise. Therefore, the allowable angular is large ( $2^\circ$ ) and the burden on the shaft is reduced. **MOM** is provided with a projection by inserting a resin pin into the spacer.

**MOM****Technical Information****• Allowable Lateral Misalignment**

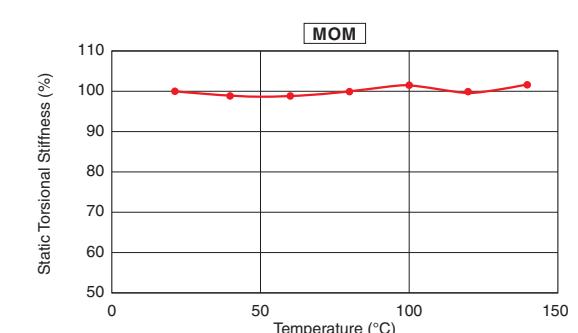

**MOM**'s allowable lateral misalignment varies depending on the load torque and revolution.

— 20 min⁻¹  
 — 50 min⁻¹  
 — 100 min⁻¹  
 — 250 min⁻¹  
 — 500 min⁻¹  
 — 1000 min⁻¹  
 — 2000 min⁻¹

**● Example**

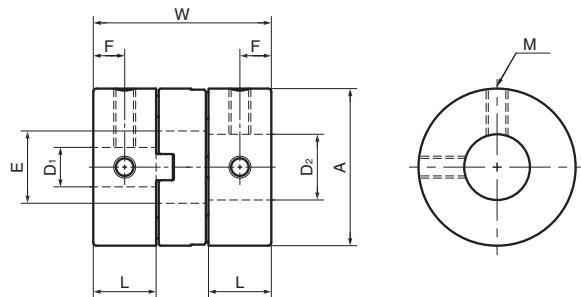

When under the condition of load torque: 25N·m and revolution: 1000min⁻¹, the allowable lateral misalignment of **MOM-55** is 0.5mm.

**● Change in static torsional stiffness due to temperature**

This is a value under the condition where the static torsional stiffness at 20°C is 100%. **MOM**'s change in torsional rigidity due to temperature is small and the change in responsiveness is extremely small.

However, if the unit is used under higher temperature, be careful about misalignment due to elongation or deflection of the shaft associated with thermal expansion.

- All products are provided with hexagon socket head cap setscrew.
- In a case where the bore diameter is φ4 or less, the setscrew is used only in one place.
- Recommended dimensional allowances of applicable shaft diameter are h6 and h7.
- A set of hubs with combination of setscrew type and clamping type or other type is available upon request.
- Additional modification for bore and keyway can be performed.
