Chapter 1 | Safety

1.1 General Safety

Safety Information:

Caution: Identifies information about practices or circumstances that can cause personal injury or equipment damage.

Warning: Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.

1.1.1 Usage

Caution

- The drive is used to control the speed of 3 phase synchronous and asynchronous motors, which must not be used for single phase or other purposes. Failure to comply could cause drive damage or serious injury by fire.
- The drive must not be used in any medical equipment in which human life may involve.
- The drive is manufactured according to strict quality control standard. However, bypass the safety protection in case the drive failure causes death or serious injury.

1.1.2 Receiving

Warning

- Do not install damaged drive or any drive without complete components inside. Failure to comply could result in accident.
- The product must be complete, including packaging, instruction and accessories.
- New or updated information, please refer to the following link:
<http://www.liteon-ia.com/TW/download.php>

1.1.3 Installation

Warning

- Carry the drive by the bottom as carrying by the front cover may cause injury and damage from the main body of the drive falling.
- Attach the drive to metal or other nonflammable materials. Keep away from heat and flammable items.
- A control panel must have cooling fans, air vents and room for ventilation when the drive is installed inside.
- The mounting surface in contact with the heat sink should be made of metal, which provides good thermal conductivity and prevents flammability
- Please check the dust-proof and moisture-proof conditions to avoid the external environment affecting the inverter function.

1.1.4 Wiring

Caution

- Allow only qualified electrical engineers to install the drive. Failure to comply could cause electrical shocks to personnel or damage to the drive.
- Ensure the power supply is off when connecting. Failure to comply could cause electrical shocks.
- Ensure the ground terminal PE is properly wired. Failure to comply could cause electrical shocks from the drive cover. Therefore ground the drive and motor for personnel safety.
- Do not touch the main circuit terminal. Keep the main circuit off drive cover to avoid electrical shocks.
- The terminal for braking resistor is B1 and B2. Do not connect it to any other terminals. Failure to comply could cause a fire.

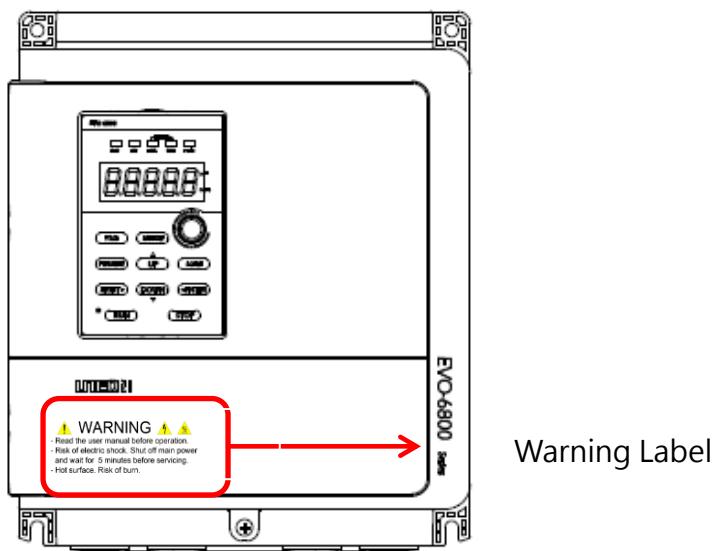

Warning

- Do not connect three-phase power supply to terminals U, V and W. Failure to comply could damage the drive.
- An output reactor is recommended when the cable connecting between the drive and motor is over 100 meters. Failure to comply could result in drive damage with overcurrent caused by over-distributed capacitance.
- Never connect the output terminals to capacitors or unapproved LC/RC filters. Failure to comply could damage the drive components.
- Separate the drive main circuit cables and control circuit cables. Failure to comply could cause interference to the control signals
- Ensure the phase of power supply and rated voltage match the label on the drive. Failure to comply could drive damage.

1.2 Warning Label

The warning label is on the front of the drive. Please read it carefully and follow the instructions.

- Read the user manual before operation.
- Risk of electrical shock. Shut off main power and wait for 5 minutes before servicing.
- Hot surface. Risk of burn.

1.3 AC Drive Application Precautions

1.3.1 AC Drive Selection

1.3.1.1 Drive Capacity

Before driving motors, ensure the motor rated current is lower than the drive rated output. In addition, when a single AC drive is driving more than 1 motor in parallel, make sure the drive capacity is higher than 110% of total motor rated current.

1.3.1.2 Starting Torque

The motor characteristics at start and during acceleration are limited by the drive overcurrent. If higher starting torque is needed, use a higher rating drive or increase capacity of both motor and drive.

1.3.1.3 Emergency Stop

When a drive fault occurs, protection function will be automatically triggered to shut off the output but the motor may not stop immediately. Therefore please install mechanical brake if immediate stop is necessary.

1.3.2 Settings

1.3.2.1 Upper Limits

The maximum output frequency of the drive is 400Hz. If the upper limit is set incorrectly, the motor will run at higher than its rated speed and cause danger. Please set the limit of output frequency in Frequency Upper Limit parameter. The default setting of the rated output frequency is 60Hz.

1.3.2.2 DC Braking

Excessive DC braking current and duration could cause motor overheat.

1.3.2.3 Acceleration /Deceleration Time (Acc./Dec. Time)

Acceleration and deceleration time is determined by the motor torque, load torque and load inertia. Set a longer Acc./Dec. time after Stall Prevention function is triggered. In addition, the acceleration and deceleration time will be extended depending on the Stall Prevention duration. If faster acceleration and deceleration are required, install proper braking options or use a higher rating motor and AC drive.

1.3.3 General Handling

1.3.3.1 Wiring

Connecting power supply to output terminals U/T1, V/T2 and W/T3 will damage the drive. Check all the connections and wiring sequence before turning on the power. Failure to comply could cause drive damage.

1.3.3.2 Maintenance

Capacitors in the drive may still be charged for a short time after shutting off the power. Wait for the amount of time specified on the drive before any maintenance. Failure to comply could cause electrical shocks to personnel. Besides, do not touch the heatsink which can be very hot during operation. Replace the cooling fan only when the heatsink has cooled down after shutting off the power. In addition, when a synchronous motor is coasting to stop, it regenerates voltage to keep the drive terminals live even when the drive power is off. Wait until the motor is fully stopped before drive maintenance. Failure to comply could cause electrical shocks to personnel.

1.3.3.3 Wiring Tools

Use only the tools suggested by the terminal supplier during drive maintenance.

1.3.3.4 Transportation and installation

Do not expose the drive to the environment containing the halogens or DOP gas during transportation or installation.

1.4 Warranty

1.4.1 Warranty Period

Contact local distributor for details.

1.4.2 Warranty Restrictions

Warranty is not applicable when the drive is not properly used according to the manual regardless warranty period.

4.1 Wiring Safety

Caution
<ul style="list-style-type: none">■ Turn off all the power to the equipment before wiring. Wiring during power on could cause electrical shocks to personnel.■ Allow only qualified personnel for installation, wiring, repairing and parts replacement.■ Capacitors in the drive may still be charged for a short time after shutting off the power. Wait for the amount of time specified on the drive before any maintenance.■ Never touch input or output power cables. Do not connect any circuit to drive enclosure.

Warning
<ul style="list-style-type: none">■ Properly connect the motor ground terminal. Contacts between the motor ground terminal and motor enclosure could cause electrical shocks or a fire.■ Ensure terminal screws are all tightened. Loose connection to the main circuit could cause overheating or a fire.■ Verify if the rated voltage of the drive matches the voltage of the incoming power supply before applying power.■ Perform all wiring as specified in the wiring diagrams provided when installing braking unit. Failure to comply could result in drive, braking unit or resistor damage or fire.■ Do not disconnect the motor from the drive while the drive is outputting voltage.■ Do not use unshielded cable for control circuit wiring. Failure to comply could cause abnormal operation of drive.■ Use shielded twisted-pair cables and connect the shield to ground terminal of the drive.■ Do not modify the drive circuits. Failure to comply could cause drive damage.■ Ensure all connections are correct after connecting the drive with other devices.

4.2.2 Main Circuit Wiring

4.2.2.1 Power Input Terminal

- Install a molded case circuit breaker (MCCB) between three phase AC input power and main circuit terminals R/L1, S/L2 and T/L3. A magnetic contactor (MC) in series connection is also suggested so as to shut off the power by drive protection functions. Install a R-C varistor on both ends of the MC.
- Ensure main circuit terminal screws are tightened to avoid vibration loosening the screws which could cause electric sparks.

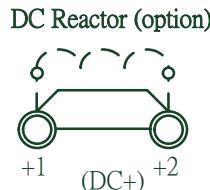

4.2.2.2 Power Output Terminal

- When connecting a noise filter at AC drive output terminals U/T1, V/T2 and W/T3, always use an inductive L-filter. Do not install any power capacitor, L-C or R-C filter.
- Connect AC drive output terminals U/T1, V/T2 and W/T3 to motor input terminals U, V and W respectively. Ensure the motor and drive terminals are in same phase sequence or the motor will rotate reversely.

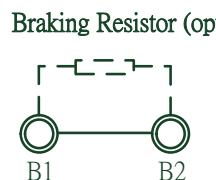

- Do not connect power cable to output terminals of the drive. Failure to comply could cause drive damage and a fire.

4.2.2.3 DC Reactor and Braking Resistor Terminal:

- The terminal is to connect a DC reactor so as to improve power factor. The drive is shipped from the factory with a short-circuit jumper. Remove the jumper before connecting a DC reactor.

- If the drive is used in a high-frequency or heavy duty application which requires frequent braking or shorter deceleration time, install an optional braking resistor to increase the braking torque.

- Please refer to the wiring diagram when installing braking options.

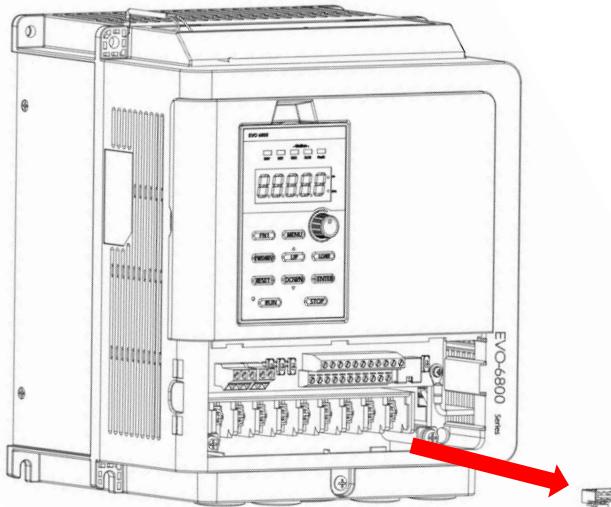

4.2.2.4 Ground Terminal

- Use grounding cables of dimensions regulated by electrical equipment standard. Shrink wiring distance to prevent leakage current resulting unstable electrical potential at the terminal distant from grounding terminal.
- Do not use share the same grounding cable with welding machines or any device requiring large current. Failure to comply could cause drive or equipment malfunction.
- Do not wind the grounding cable when multiple drives are installed. Failure to comply could cause drive or equipment malfunction.
- Ensure the neutral of the input side and drive terminal " " are grounded according to the local electrician regulations. 3WYE (e.g. TN and TT) system are suggested for the drive primary side.

4.2.2.5 Jumper :

- EVO6800 complies with the European LVD standard EN 61800-5-1 (2007) reducing the touch current to below 10mA DC under testing condition regulated by IEC 60990 (1999).

- Follow the instructions below to remove the jumper if an even lower current leakage to a even lower level.
- Removing the jumper may increase the signal interference

4.2.2.6 Ring Terminal

- Main circuit terminal should be used with crimp ring terminal wiring .
- Please refer to the diagram about ring terminal size, where the 8 AWG and 10 AWG bare recommend using W size must be less than 10.5 mm, d2 size must be greater than 5.0
- Ring terminal shall be insulated cover of the terminal block wiring, which can form a reference KST RVBS8-5 & KST RVB5-5 or similar size ring terminals to facilitate wiring and other operations

AWG 10	RVB5-5	9.5	5.3	3.4	6.4	8.3	13	26	1

4.2.3 Main Circuit Cable Size and Tightening Torque

Select the cables and crimp terminals according to Table 4.2.2.

1. The recommended cables (copper conductors) are 600 V vinyl-sheathed cables which have continuous temperature tolerance up to 75°C with ambient temperature tolerance up to 40 °C, wiring distance up to 100 meters and conditions suitable for on Normal Duty mode.
2. Terminal +1, +2, B1 and B2 are only for connecting DC reactor and braking resistor options. Do not connect it to other devices.
3. Consider the amount of voltage drop when selecting cable sizes. Increase the cable size when the voltage drop exceeds 2% of the motor rated voltage. The amount of voltage drop can be calculated using the following formula:

$$\text{Line drop voltage (V)} = 3 \times \text{cable resistance } (\Omega/\text{km}) \times \text{cable length (m)} \times \text{current (A)} \times 10^{-3}$$

Chapter 7 | Communications

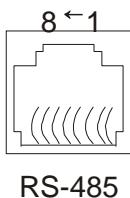

7.1 Modbus Communication Specifications

Item	Specifications
Interface	RS-485
Communications Cycle	Asynchronous
Communication Parameters	Communication speeds
	Data length
	Select even, odd or none
	Stop bit
Protocol	Modbus
Max number of Slaves	31 AC drives

7.2 Connecting to Controller/PLC/HMI

7.2.1 Communication Cable Connection

1. Connect the communications cable to the drive and the controller/PLC/HMI when the power is cut off. Use the drive terminal RJ45 for Modbus communication.

Modbus RS-485
Pin 1~2, 7, 8: Retain
Pin 3, 6:SGND
Pin 4:SG-
Pin 5:SG+

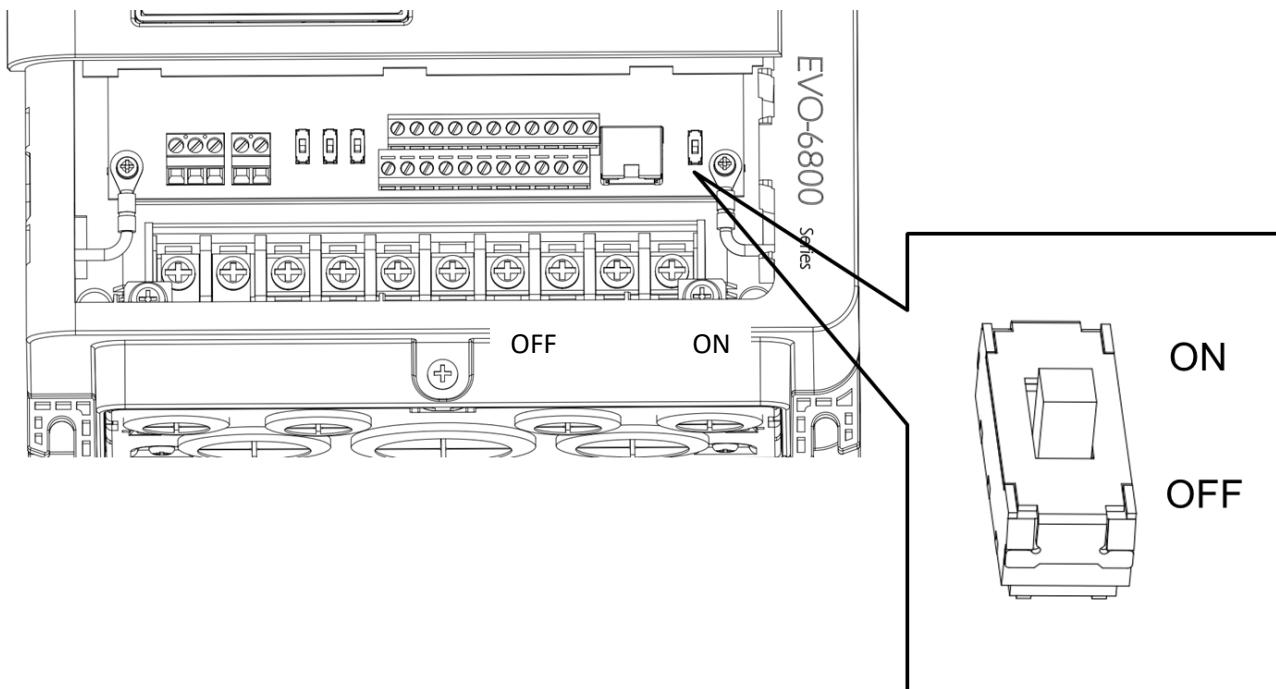

Note: To prevent the interference, separate the communications cables from the main circuit cables, power cable and other wiring. Always use shielded cables for the communications cables, and shielded clamps.

2. Ensure the termination resistor is installed in the last drive of the slave series.
3. Turn the power on.
4. Set the parameters needed for the communication(E6 - 00 to E6 - 12) using the keypad.
5. Shut the power off and wait until the display goes out.
6. Turn the power on.
7. The communication between the drive and the controller/PLC/HMI is now ready.

7.2.2 Termination Resistor Setting for Multiple Connections

The default of termination resistor for RS-485 communication is OFF. Switch this DIP switch to ON

when the drive is the last in a series of slave drives. In addition, make sure this DIP switch RS-485 in all other slaves is placed to OFF.

7.2.3 Termination Resistor Function

- Interference signal suppression
- Wiring impedance balance

7.2.4 When to Install Termination Resistor

Install the termination resistor in the drive on the end of the network and the master device to suppress the interference signal in the following situations. (Note: The installation must be on the both ends)

1. Multiple devices are connected by the network.
2. The communication cable is too long.
3. Multiple devices are connected via long communication cables.
