## *InoTouchPad UI framework*

## UI Introduction

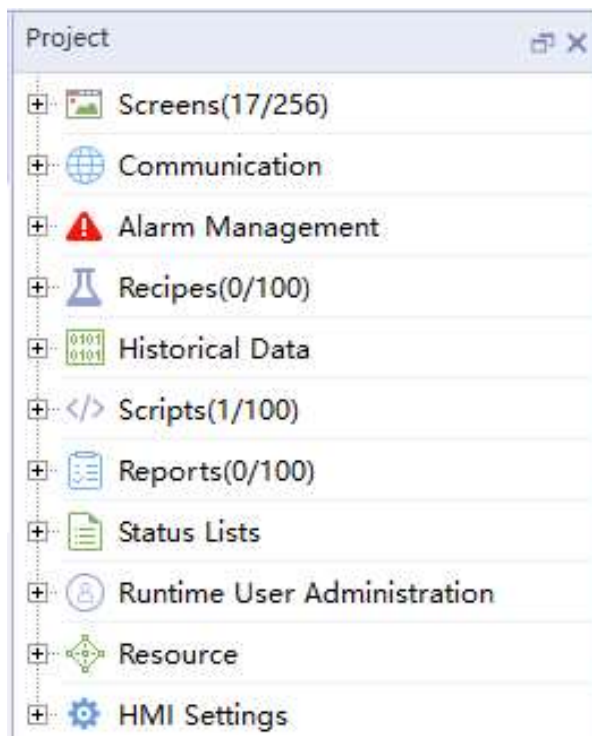

INOVANCE

[Back to Contents](#)

- Multiple function areas
- Visual display
- Convenient Operation

### ➤ Project Device Tree

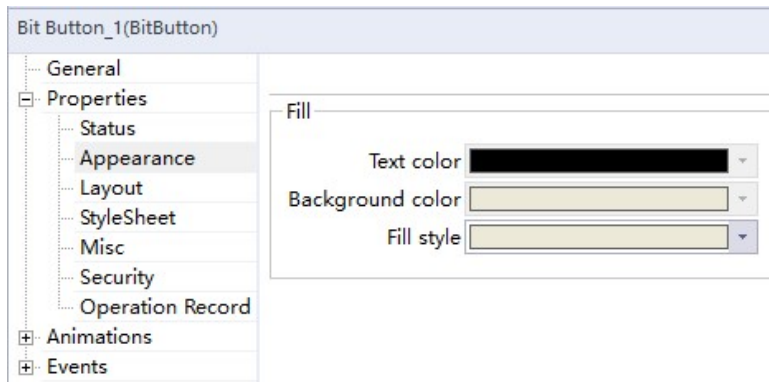

- **Screens:** Create/Delete users' screen or templates
- **Communication:** Create/Delete communication connection/variants
- **Alarm Management:** Create alarm item, set alarm condition, content and display mode
- **Recipes:** Create recipes and recipe data
- **Historical Data:** Create historical data record
- **Scripts:** Create script program file
- **Reports:** Set table view display
- **Status List:** Create graphical/text lists for controls with state transitions
- **Runtime User Administration:** Create users/user group and user authority management
- **Resource:** Set project language
- **HMI Settings:** Project management and setting

### ➤ Details View

Details View		
Id	Name	Info
202	Rectangle_2	RectItem
203	Bezier_1	Bezier
204	Table_1	Table
205	Bit Button_1	BitButton

- Display all controls in current screen, when there are too many controls in the screen, users can select specified controls in details view
- Display all single controls of a combination control, when users need modify specified control of a combination control, they can select in details view
- Display variants of a variant group. You can drag/drop the variants in details view to work area directly

### ➤ Properties Setting

- **General:** General Settings
- **Properties:** Including status, appearance, style, operation authority etc.
- **Animations:** Sets the controls to move according to setting conditions
- **Events:** Different operation of controls can map to system event(functions) to operate project objects.

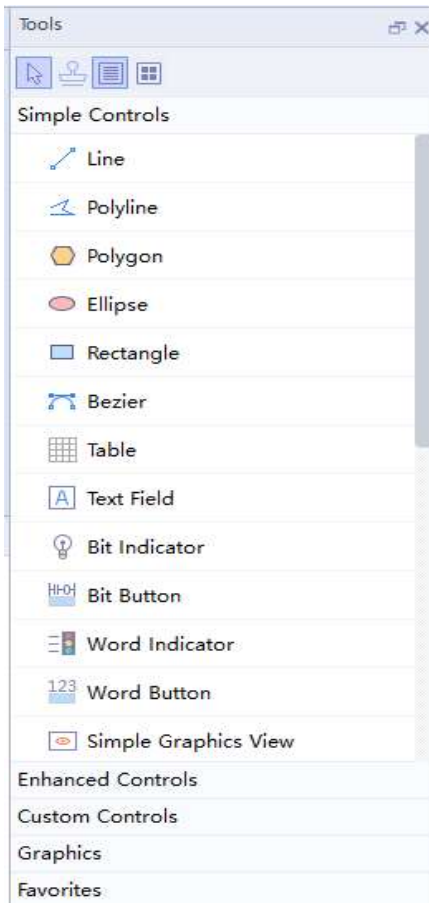

## ➤ Output View

Output	
Category	Description
Info	Compiling started ...
Info	Optimize images size ...
Info	the total size of compiled files is 3516 KB
Info	Compiling finished!
Info	### Compiling results: 0 error(s), 0 warning(s).

- Display the compile result of software configurations

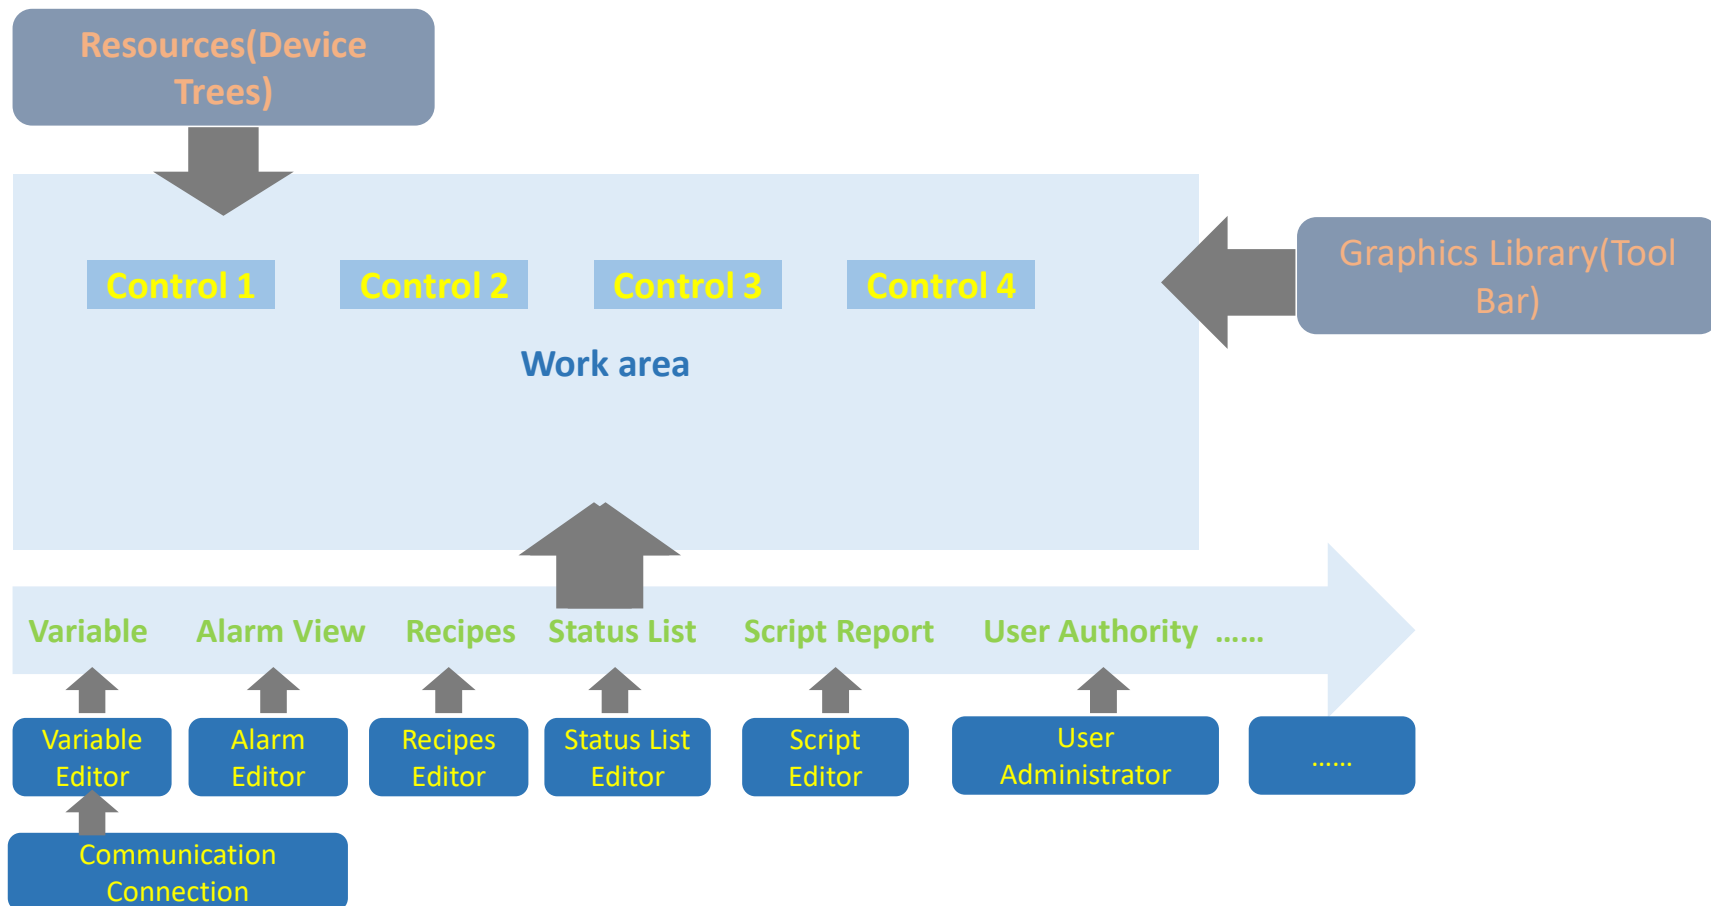

### ➤ Tool Bar

- Tool navigation window, containing system-supported configuration controls and gallery, can be dragged directly to the work area.
- **Simple Controls:** Vector drawing controls, buttons, switches, image display controls, numerical input and display, text input and display, etc.
- **Enhanced Controls:** Functional Controls like bars, slider, alarm view, data view, etc.
- **Custom Controls:** It is an extensible function supported by the system. Users can develop specified controls by using QT development environment( third party).
- **Graphics:** Vector graphics and various formats of pictures for graphical display of controls
- **Favorites:** Collection of good configuration of specific functions of the object, reuse directly by dragging to work area.

## *InoTouchPad Configurations*

### ➤ Configuration Model

## ➤ Communication Connection

The screenshot displays the 'Communication' section of the software. On the left, a tree view shows 'Communication' expanded, with 'Connections' highlighted. The main area features a table of connections:

	Name	Number	Communication protocol	Default status	Address edit ...	Comment
1	Connection_5	5	AM600 Modbus TCP Protocol	Online	Decimal	

Below the table, the 'Interface' is set to 'Ethernet'. The 'Slave Device' configuration is shown with the following values:

- IP Address: 192.168.1.100
- Port: 502
- Slave address: 1
- Timeout: 100 ms
- Comm. Delay: 0 ms
- Response Delay: 0 ms
- Resend Counts: 3

On the right side, a list of communication protocols is displayed, including Inovance, Omron, Siemens, Mitsubishi, Modicon, Delta DVP, Panasonic, Free Protocol, OPC, koyo, FATEK, Xinje, and Keyence.

Get into Communication >> Connections, then add a connection and select communication protocol. Be noted users can select the address edit mode as Decimal or Hex.

## ➤ Communication Cycles

	Cycle time	Number	Cycle unit	Name	Comment
1	1	1	Hour	1h	
2	1	2	Minute	1min	
3	1	3	Second	1s	
4	10	4	Second	10s	
5	100	5	Millisecond	100ms	
6	2	6	Second	2s	
7	5	7	Second	5s	
8	500	8	Millisecond	500ms	

Address	Acquisition cycle	Id	Name	Info
MW 0	100ms			
MW 10				
MW 20				
MW 30		2	1min	1 Minute
MW 40		3	1s	1 Second
MW 100		4	10s	10 Second
		5	100ms	100 Millisecond
		6	2s	2 Second

A 'cycle' is a pre-defined time for tag(variable) capture(or refresh) cycle which can be used in 'Tags'. There are some built in cycle time(100ms, 500ms, 1s, 1 min, etc.), Users can add customized cycle time as they want.

### ➤ Variables

Add Variable >> Set 'Name', 'Connection Id', 'Address' .....

The screenshot displays the 'Tags' management interface. On the left, a sidebar contains a tree view with 'Communication' expanded, showing 'Connections', 'Cycles', 'Tags(3/64)', 'MQTT', and 'Alarm Management'. The 'Tags(3/64)' folder is highlighted with a red box, and its sub-items 'Show All Tags', 'Add Tag Group', 'System Tags', '变量组\_2', and 'Tag group\_1' are visible. The main area shows a table with the following data:

	Name	Number	Connection Id	Data type	Length	Array count	Address	Acquisition cyc.	Acquisition m...	Data log Id	...
1	Q 0	28	Connection_5	Int16	2	1	Q 0	1s	Cyclic on use	<Undefined>	1s

Communication >> Tags >> Add Tag Group >> Select specified Tag Group

### ➤ System Variable

The screenshot displays the INOVANCE software interface for managing tags. On the left, a tree view shows the project structure, with 'System Tags' highlighted under the 'Tags(3/64)' folder. The main area features a table of tags and a detailed view for the '\$Year' tag.

	Name	Number	Connection Id	Data type	Length	Array count	Address	Acquisition
1	\$Year	29	<Internal tag>	Int16	2	1	LW 9000	1s

Below the table, the '\$Year (Tags)' properties are shown in a 'General' tab. The 'Name' is '\$Year', 'Connection' is '<Internal tag>', 'Array count' is '1', and 'Length' is '2'.

On the right, a list of system variables is displayed, including:

- System Time
  - \$Year
  - \$Moth
  - \$Day
  - \$Hour
  - \$Minute
  - \$Second
  - \$Weekday
- Network Settings
  - \$MACAddress
  - \$IPAddress
  - \$Netmask
  - \$Gateway
  - \$DNS1
  - \$DNS2
- User Administration

System Tags are built in variable which can be directly used by users.

### ➤ Map Variables to Controls

1. Click specified Control

2. Read Tag

3. Select Tag Group.('All Objects' as default)

4. Select Variable

	Id	Name	Info	Connection
22	25	D 6_1	LW 6	<Internal tag>
23	26	LW 2010	LW 2010	<Internal tag>
24	27	LW 2011	Q 2011	Connection 5
25	28	Q 0	Q 0	Connection_5
26	29	\$Year	LW 9700	<Internal tag>

## ➤ Variables Properties

- ✓ Name
- ✓ Number
- ✓ Connection
- ✓ Data type
- ✓ Length
- ✓ Array count
- ✓ Address
- ✓ Acquisition cycle
- ✓ Acquisition mode
- ✓ Data log
- ✓ Logging cycle
- ✓ Logging acquisition mode
- Upper limit
- Upper limit alarm
- Lower limit
- Lower limit alarm
- Linear scaling
- Upper PLC scaling value
- Lower PLC scaling value
- Upper HMI scaling value
- Lower HMI scaling value

1	Number	Tag ID, assigned automatically
2	Connection	Tag Connection:select tap map to certain connection(or device)
3	DataType	Data type:int16,int32,uint16,uint32,float,double, string,bool,datetime,wstring
4	Length	Tag length(byte), calculate automatically according to data type and arry count
5	ArrayCount	while array count >1, am array will be create and can be access via format like tag[array index]
6	Address	Tag map address
7	AcquisitionCycle	Refresh time of tag
8	AcquisitionMode	Cyclic on use: update when use tag in current screen On demand: update via invoke function 'UpdateTag' cyclic continue: keep updating
9	DataLog	Data log of tag, undefined as default, if need record tag value, need select certain datalog
10	LoggingCycle	capture time of tag
11	LoggingAcquisitionMode	On change: capture when value change On demand: capture via invoke function 'LogTag' cyclic continue: keep capturing

12	UpperLimit	Upper limit
13	UpperLimitAlarm	Optional, if selected while over uppper limit there is an alram occur
14	LowerLimit	Lower limit
15	LowerLimitAlarm	Optional, if selected while below lower limit there is an alarm occur
16	LinearScaling	Enable linear scaling
17	UpperPLCScalingValue	if upperPLCscalingvalue=100/lowerPLCscaling value=0 and upperHMIscalingvalue=10/lowerHMIscaling value=0, then when PLC(or other device) register value=50, the tag display in HMI=5
18	LowerPLCScalingValue	
19	UpperHMIScalingValue	
20	LowerHMIScalingValue	
21	StartValue	Original value of tag
22	TagGroup	TagGroup
23	Comment	variable comment, no more than 500 characters

### ➤ Variable Properties

The screenshot shows the 'D 0 (Tags)' dialog box with the 'General' tab selected. The left sidebar lists various properties: General, Properties, Addressing, Limits, Linear Scaling, Logging, Start value, Comment, Events, Change value, High limit, and Low limit. The main area displays the following settings:

- Name: D 0
- Connection: <Internal tag>
- Data type: UInt16
- Acquisition mode: Cyclic on use
- Acquisition cycle: 1s
- Array count: 1
- Length: 2
- Group: 变量组\_2

Callouts provide additional information:

- Data Type:** Int/UInt(16/32), Double, Float, Bool, String, Wstring, DateTime
- Array Count:** When > 1, variable is an array.
- Connection:** select connections between HMI and other device(PLCs, Servo, AC drives)
- Acquisition Mode:** Cyclic on use, Cyclic continuous, On demand
- High Limit/Low Limit:** (points to the 'Limits' section in the sidebar)

## ➤ Screen

Screen is the basic unit of HMI runtime display. The screen can be divided into basic screens, embed screens, pop-up screens and template screens. The contents of the template screen are generally public controls and objects in user projects. For example, the menu buttons designed in the template are available for every screen.

## ➤ Screen Normal Properties

**Number:** Set screen number(Numbers are not repeatable)

**Background color:** Set screen background color

**Page Switching:** Set the effect of switching screen

**Template:** Select a template screen(reuse the public controls in template screen)

**Layers:** InoTouchPad support up to 32 layers. Users can define the specified layer of each control in the screen, When there are too many controls in a screen users can assign them to different layer to have a better management. For example, when selecting layer00 and layer01, only controls of layer00/layer01 display in the work area.

## Alarm Management

INOVANCE

[Back to Contents](#)

Alarm Management contains Analog Alarms, Discrete Alarms, System Alarms, Alarm Classes and Alarm Groups

## Alarm Data

INOVANCE

[Back to Contents](#)

**Analog Alarms:** The analog alarm is bound to the analog variable, and alarm will be triggered when the analog variable value meets the set conditions

**Discrete Alarms:** The discrete alarm is bound to the discrete BOOL variable, and alarm will be triggered when the state transition of the discrete variable meets the set conditions

Alarm Text (Analog alarms)

### ➤ Alarm Events

Alarm have 3 status corresponding 3 events: Activate, Deactivate and Acknowledge. Every event can be bound to system functions/user scripts to achieve special requirements.

## ➤ System Alarm

Analog Alarms x Discrete Alarms x System Alarms x Alarm Classes x Alarm Groups x				
	Text	Alarm classes	Event number	Enabled
1	Log %1 is full.	System	100001	<input checked="" type="checkbox"/>
2	Log %1 is %2 percent full.	System	100002	<input checked="" type="checkbox"/>
3	Connection failure: %1, station %2.	System	100003	<input checked="" type="checkbox"/>
4	Connection successful: %1, station %2.	System	100004	<input checked="" type="checkbox"/>
5	Invalid input of date/time.	System	100005	<input checked="" type="checkbox"/>
6	Overflow range,the valid range is [%1-%2].	System	100006	<input checked="" type="checkbox"/>
7	The Medium of Log is full .	System	100007	<input checked="" type="checkbox"/>
8	Tag %1 can not write to PLC.	System	100008	<input checked="" type="checkbox"/>
9	Invalid PLC job number: %1.	System	100009	<input checked="" type="checkbox"/>
10	No other screens can be selected. No other screens are store...	System	100010	<input checked="" type="checkbox"/>
11	SIM status: %1.	System	100011	<input checked="" type="checkbox"/>
12	IOT status: %1.	System	100012	<input checked="" type="checkbox"/>
13	Connection off line: %1, station %2.	System	100013	<input checked="" type="checkbox"/>

**System Alarm:** Only reflects the state of system storage space, peripherals and ports. System alarm can not be changed but can set whether to enable this alarm.

There are 2 controls used for display alarm. Alarm bar is used to display real time alarm whereas alarm view is used to display real time alarm or historical alarm.

### ➤ Historical Alarm view

Step 1: Get into 'Historical Data' >> 'Alarm Logs' and add an alarm log. Users can set the name, record number and save path for this log. Besides, there are 3 logging method available:

**Raise event:** while alarm records over limit, the 'Overflow' event triggered

**Display system alarm:** While alarm records over \*\* % of limit, a system error will occur to remind users

**Circular log:** cyclic record. While records over limit, remove the earlier records

	Name	Number	um of data records per lo	Path	og alarm text and error locat.ogging meth..	Fill level	nable logging at runti

## Alarm Data

INOVANCE

[Back to Contents](#)

Step 2: Back to 'Alarm Classes', select the alarm log. In this way all alarms of this class will be added to the alarm log.

The screenshot displays the 'Alarm Classes' configuration window. The left sidebar shows the project structure with 'Alarm Management' expanded. The main area shows a table of alarm classes. The 'Errors' class is selected, and its 'Log' is set to 'AlarmLog'. An orange arrow points from the 'Errors' class to a detailed view of the 'AlarmLog' table, which lists six error entries, all categorized under the 'Errors' class.

	Name	Display name	Ack	Log	C color	CD color	CA
1	Errors	!	On "activated"	AlarmLog	Red	Red	Black
2	Warnings	#	Off				
3	System	\$	Off				
4	DeviceInfo	%	Off				

	Id	Name

4	Water lever over 40!	4	Errors
5	The value is above upper limit	5	Errors
6	The value is below lower limit	6	Errors

34

## Alarm Data

Step 3: Add an alarm view to screen and select 'Alarms log' display.

**\*Note:** if want to display real time(current error), select 'Alarms'.

The screenshot shows the INOVANCE software interface for configuring an alarm view. The main window displays a table for 'Alarm Log' with columns: Text, Name, Number, Time, Date, State. Below the table, there are three rows for 'Alarm Trigger Tag' (LW0, LW1, LW2) with corresponding 'LB0 Toggle', 'LB1 Toggle', and 'LB2 Toggle' buttons. A note at the bottom states: '\*When LW0>10 or LW1>100 or LW2>1000 error(s) occur'. The bottom panel shows the 'Display' settings for 'AlarmLog', with 'Alarms log' selected and 'Show grid' unchecked. The right sidebar lists various controls, with 'Alarm View' highlighted.

## ➤ Recipes System Model

## ➤ Recipe Data Object

Recipes consist of elements, each element is bound to a variable. Users can define more than 1 recipe in project

\*Note: support **100** recipes in a project, each recipe support up to **32767** elements

Elements		Data records				
<div><div>+</div></div>	Name ▾	Display name	Tag	Default value	Decimal ▾	Information text
1	Element_1	Element_1	D 0	0	0	
2	Element_2	Element_2	D 1	0	0	
3	Element_3	Element_3	D 2	0	0	
4	Element_4	Element_4	D 3	0	0	
5	Element_5	Element_5	D 4	0	0	

Elements		Data records						
<div><div>+</div></div>	Name	Display name	Number	Element_1	Element_2	Element_3	Element_4	Element_5
1	DataRecord_1	DataRecord_1	1	0	0	0	0	0

Each recipe can have 1(or more) data record(s) for elements

\*Note: each recipe support up to **1000** records.

5	Element_5	Element_5	D 4	0	0	

**Synchronize Tags:** while select the option, users can synchronize the recipe data record value with the recipe variable(Tag)

**Tags Offline:** while select this option, while HMI recipe variable change, the PLC(or other device) registers will not be impacted.<sup>38</sup>

### ➤ Recipe Management

Application scenarios	Synchronize Tags	Tags Offline
A	No	No
B	Yes	Yes
C	Yes	No

**Operation A:** While exchange data record the PLC(or other slave device) registers will not change unless manually download to PLC.

**Operation B:** While exchange data record the PLC(or other slave device) registers will not change unless manually download to PLC. Besides, the data record in recipe view can be modified via recipe variable(HMI tags), users can synchronize the values by execute 'Synchronized Tags' command.

**Operation C:** while HMI recipe data record change, the PLC(or other device) registers will change directly.

## ➤ Add a Data View control

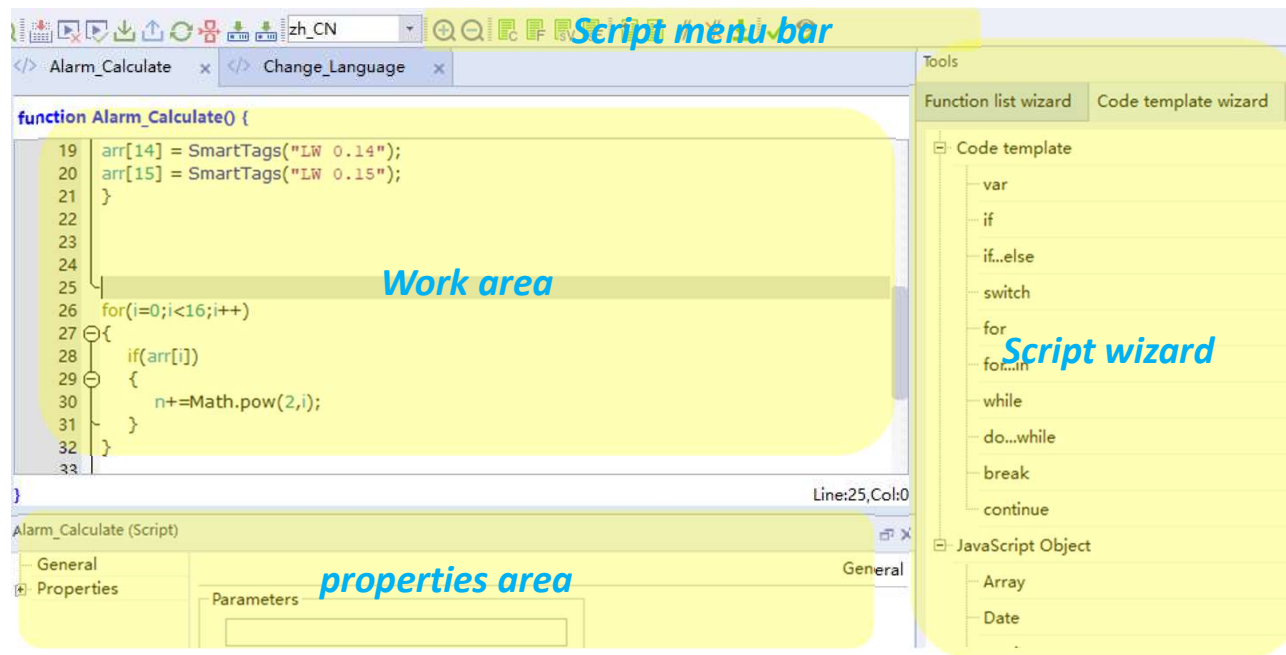

Tool bar

## ➤ JavaScript

\* IT7000 can support JavaScript.

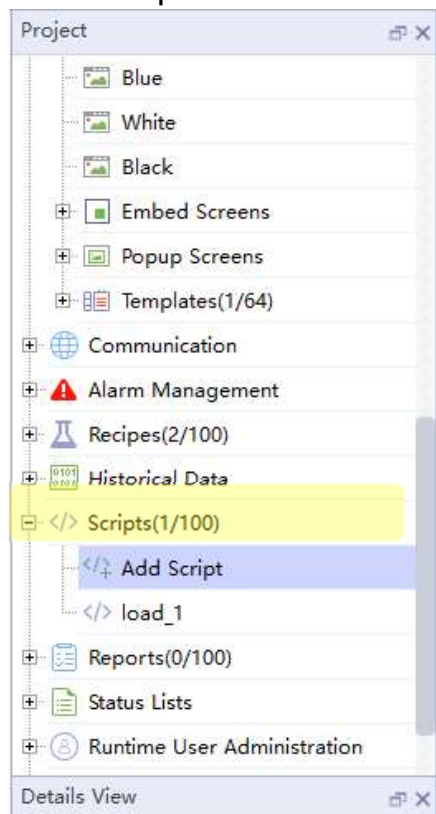

Users can do logical operations,  
read and write variable values  
via script

\* Up to 100 scripts can be  
created, and scripts are not  
allowed to call each other

## ➤ Map to Control's Events

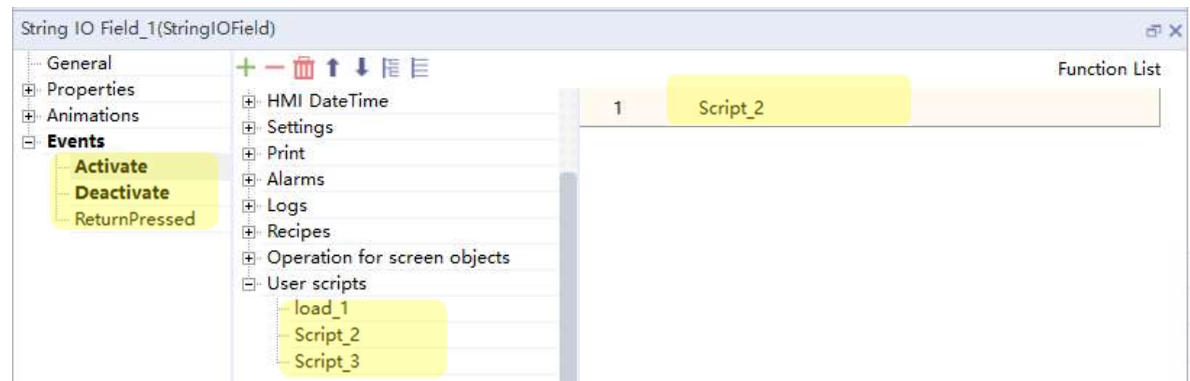

Device tree>> Scripts >>  
Add Script

Add codes to operate  
variables/screens or do logic  
calculation

```
function Script_20 {
1 SmartTags("D 24")="INOVANCE";
2 ActivateScreen("3D Pie Chart");
}
```

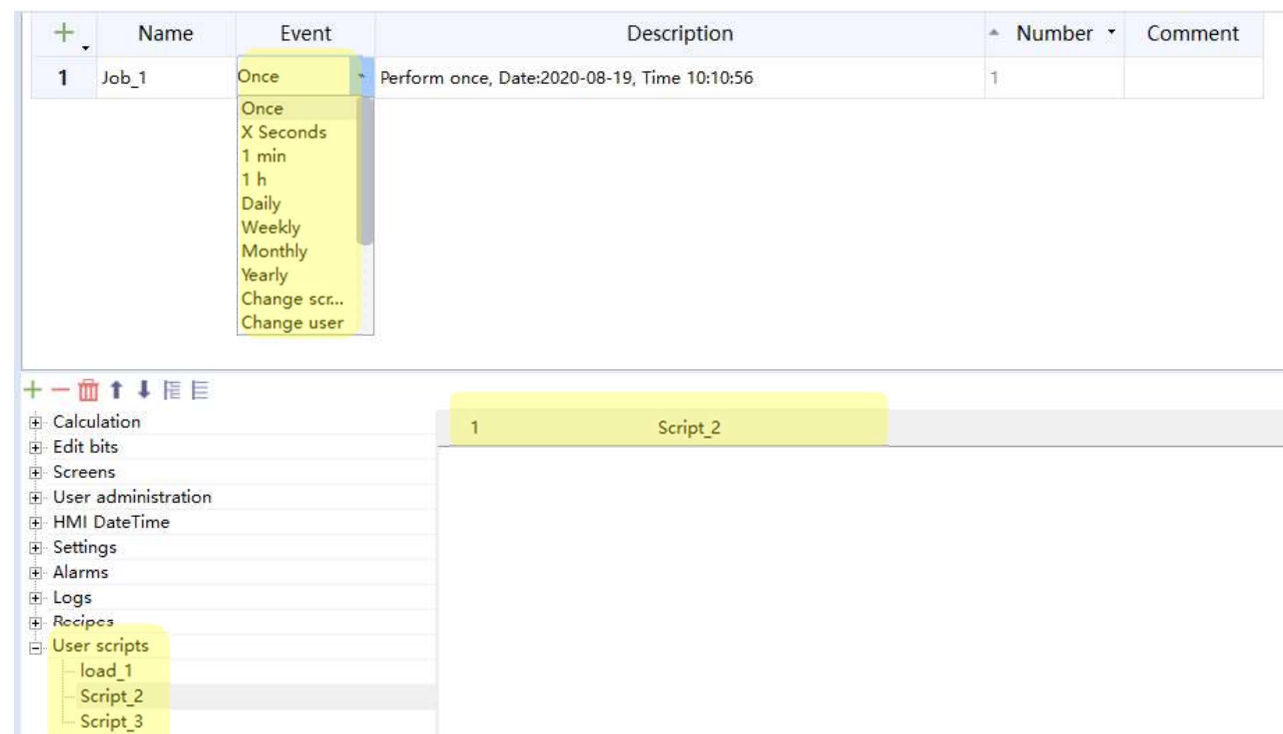

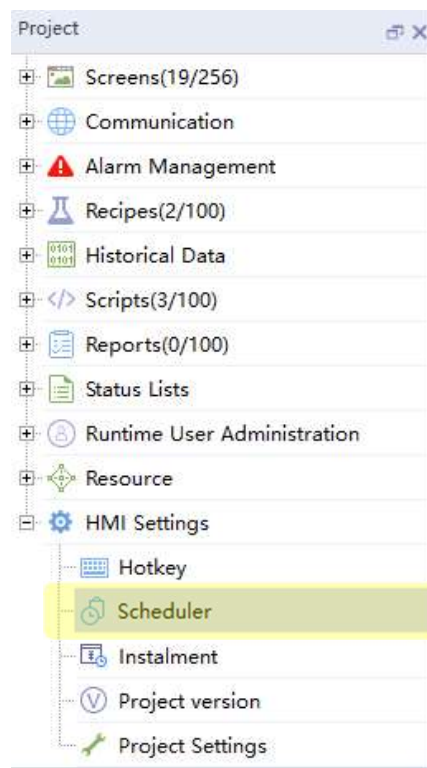

## MAP to control's events

## ➤ Arranged via Scheduler

Device tree>> HMI  
Settings >> Scheduler

Add a new job by clicking '+' icon, and you can select event execution mode(once/X second/.....)

## ➤ Function list wizard

IT7000 can easily configure simple script without too much work on programming with wizard navigation, in the tool box 'Function list wizard', users can add the wanted system function to script.

The screenshot shows the 'Function list wizard' interface. The main script editor displays the following code:

```
function Script_14() {  
1  DecreaseValue(SmartTags('LW 0'),1,0);  
2  
}
```

Annotations on the screenshot indicate the steps:

- 1. Add or delete a function**: Points to the function list on the right.
- 2. Set the parameters**: Points to the 'Parameters' section at the bottom.
- 3. Add to anyplace of the script**: Points to the 'Add' button in the 'Parameters' section.
- 4. effect**: Points to the 'DecreaseValue' function in the script editor.

The 'Function List' on the right shows the following table:

Function	Tag(InOut)	Value	Reset
1 DecreaseValue	LW 0	1	No

The 'Parameters' section at the bottom has an 'Add' button and 'Change' and 'Remove' buttons.

The screenshot shows the 'Tools' panel with the 'Function list wizard' and 'Code template' tabs. The 'Function List' section shows the following table:

Function	Tag(InOut)	Value	Reset
1 DecreaseValue	LW 0	1	No

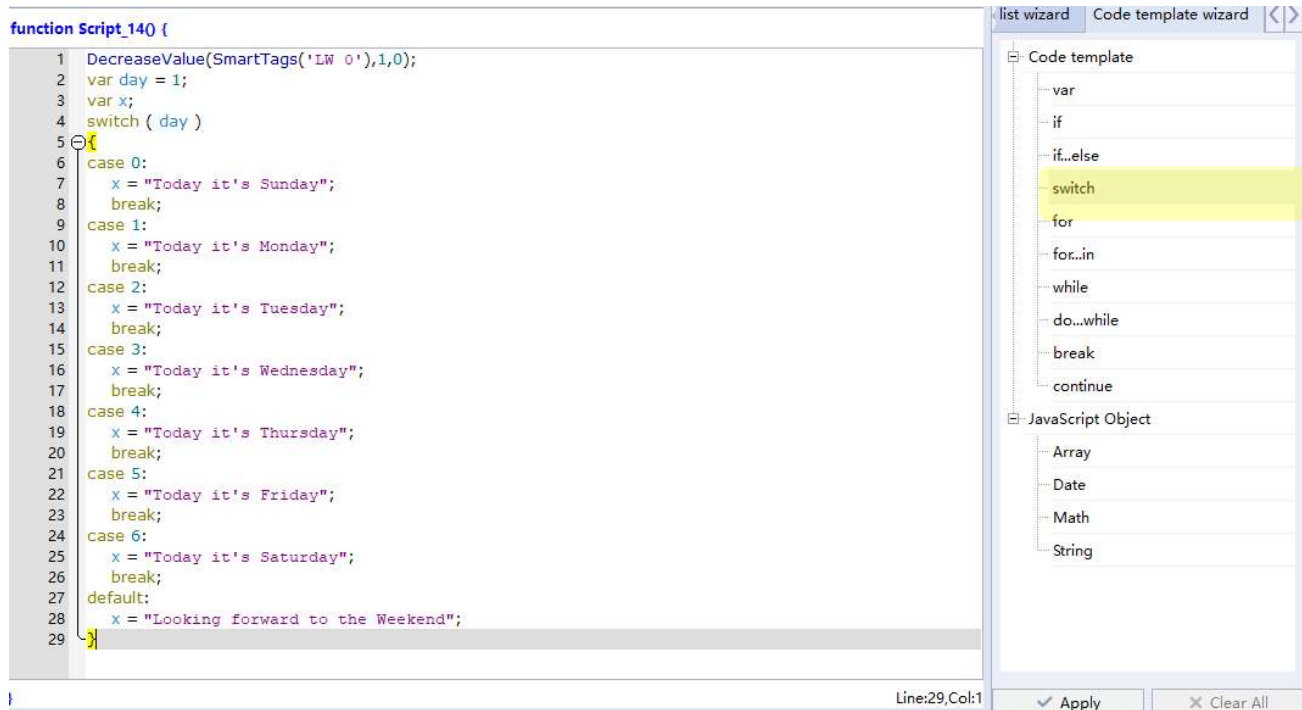

The 'Calculation' section shows the following list of functions:

- DecreaseValue
- IncreaseValue
- InverseLinearScaling
- LinearScaling
- SetValue
- Random

The 'Edit bits' and 'Screens' sections are also visible.

## ➤ Code template wizard

There are also built in template for commonly used code in the 'Code Template Wizard' in the tool box. Only need click the certain item, a piece of code with comments will generated automatically.

## *Report*

A report object is used to display predefined data and text in the form of a table. Its cells can be associated with variables for display and input.

**Report Object**

**Report View**

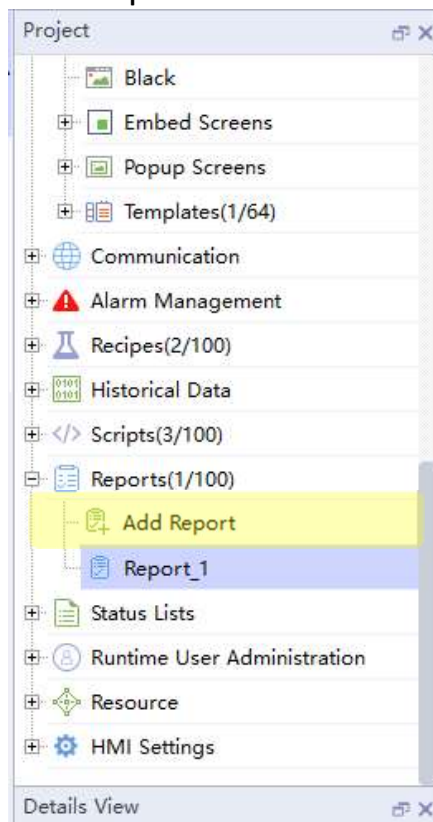

## Report

INOVANCE

[Back to Contents](#)

### ➤ Create a Report

Device tree>> Reports >>  
Add Report

### Edit Report

The 'Edit Report' interface shows a table with 5 columns and 5 rows. The table content is as follows:

	1	2	3	4	5
1	Report Title				
2	Item	IT7070E	IT7070T	IT7100E	IT7150E
3	Size				
4	Resolution				
5	Ethernet Port				

A context menu is open over the table, showing options: Span, Division, Insert Row(s), Delete Row(s), Insert Column(s), Delete Column(s), multiCopy, and Show Table Property. A yellow callout box points to the table with the text: "Select cell(s) right click to delete/insert".

Below the table, the 'Report\_1 (Report)' properties are shown. The 'General' tab is active, and the 'Expression' section is expanded. The 'Simple Calculate' option is selected, and the 'sum' variable is chosen from the dropdown. A yellow callout box points to this section with the text: "Map to variable".

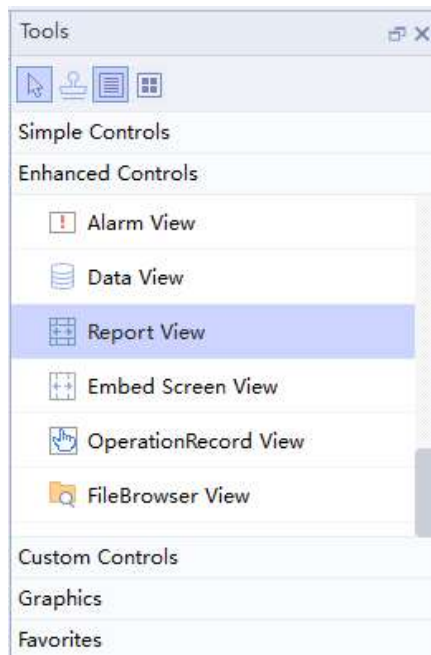

On the right, the 'Advance Calculate' option is also shown. It includes a text box for the expression:  $R3C2 * R3C3 - R3C4$ . Below the text box, it says: "Using RxxCyy can be specified to participate in the calculation of the cell is located xx Row yy column". A 'Check' button is at the bottom. A yellow callout box points to this section with the text: "Using RxxCyy can be specified to participate in the calculation of the cell is located xx Row yy column".

## ➤ What is VNC

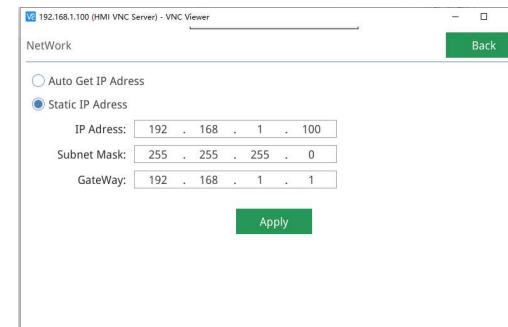

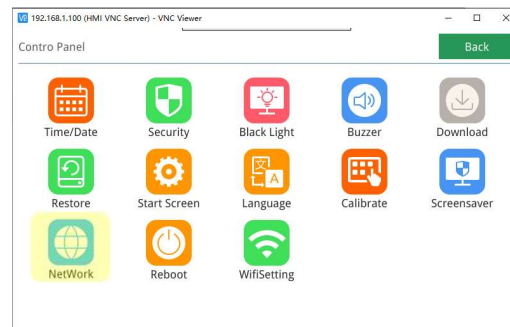

**VNC** is Virtual Network Console which used for remote monitoring. It is an excellent remote control tool developed by the famous AT&T European Research Laboratory. VNC consist of 2 part: VNC server and VNC client. IT7000 is a VNC server which can be accessed by VNC client like PC or cellphone.

**InotouchPad** integrate the VNC client application '**VNC Viewer**' which can be directly used to remotely control an activated IT7000 series HMI(with Ethernet port) .

## ➤ Connect to HMI via VNC view

**Step1: Use an Ethernet cable to connect PC and HMI**

**Step2: Modify the IP address of HMI or PC to keep PC & HMI share the same network segments(first 3 segments of IP)**

## VNC

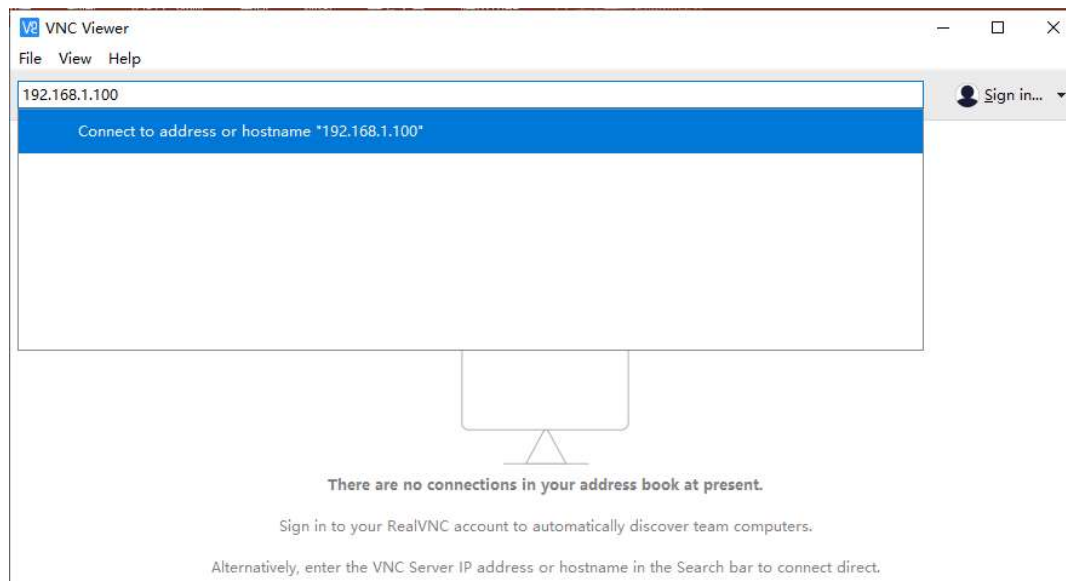

INOVANCE

[Back to Contents](#)

**Step3: Open InoTouchPad software, menu bar >> Tool >>VNC to open VNC Viewer**

**Step4: Enter the IP address of HMI(default IP:192.168.1.100) ,then select 'connect to address or hostname "192.168.1.100"' or press 'Enter' key to connect.**

If below warning pop up, just click '**continue**'

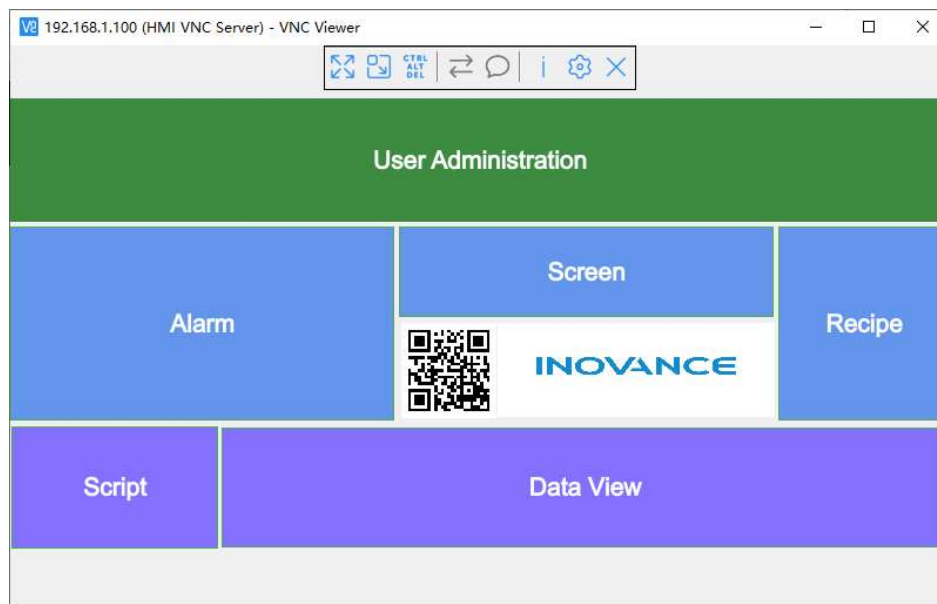

## VNC

INOVANCE

[Back to Contents](#)

After connection established, PC can remotely monitor/access HMI via VNC Viewer.

Modify connected device name like 'IT7070E PMTS' instead of '192.168.1.100'

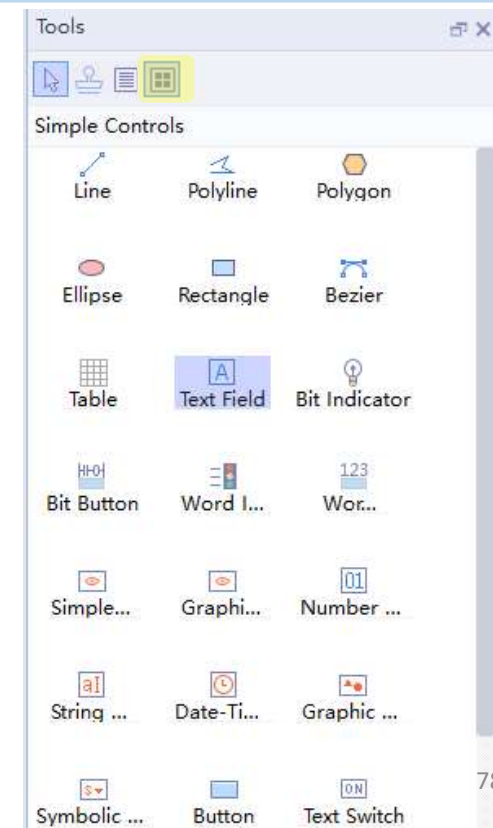

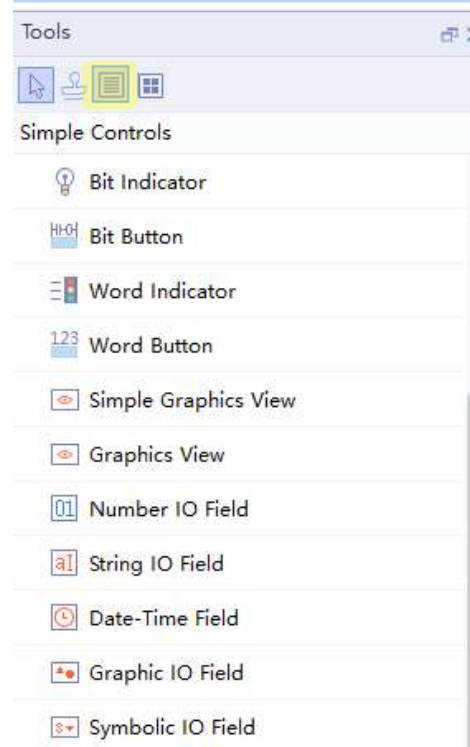

## *IT7000 Controls*

Menu bar 'View' to show the 'Tools', the tool box will pop up in the right of InoTouchPad development interface.

There are 2 modes to display the controls—List view(Left) and thumbnails view(Right).

**\*Users can add the controls from tool box.**

## Table

INOVANCE

[Back to Contents](#)

The screenshot displays the INOVANCE software interface. At the top, a blue header bar contains the word 'Table' in a stylized font. To the right of the header, the 'INOVANCE' logo is visible, along with a 'Back to Contents' link. The main workspace is a light blue area with a grid. A table control is placed on the grid, with a red cursor pointing to its top-left corner. The table has four columns and three rows. The columns are labeled 'Style', 'Indicator', and 'Description'. The rows are labeled 'Bit Button', 'Word Button', and 'Button'. The table content is as follows:

	Style	Indicator	Description
Bit Button	OFF	OFF	2 states: 0 or 1 (On or Off)
Word Button	0	0	Many states: depend on value
Button	Button	-	No states, Only Configure event

Below the table, a 'Table\_1(Table)' panel is visible. It contains a 'General' tab and a 'Settings' section. The 'Settings' section has two dropdown menus: 'Rows' set to 4 and 'Columns' set to 4. To the right of the main workspace, a 'Simple Controls' panel is open, showing a list of controls: Line, Polyline, Polygon, Ellipse, Rectangle, Bezier, Table (highlighted), Text Field, Bit Indicator, Bit Button, Word Indicator, Word Button, and Simple Graphics View.

'Table' control support to draw a simple table, the color and border/fill type are adjustable.

### ➤ Built in Graphics

InoTouchPad provide many in built graphics for users to configure the HMI screen. Select 'Graphics' and find the InoTouchPad installation path then open the folder 'Graphics', drag and drop the figure directly to screen.

## GIF Display View

INOVANCE

[Back to Contents](#)

A GIF display view support to display a gif format picture.

The screenshot displays the INOVANCE software interface with a focus on the GIF Display View configuration. The main workspace shows a control panel with two fan icons labeled 'Air Inlet' and 'Air Outlet'. Each fan has associated 'Temp' and 'Humidity' readouts and a 'Switch' control. An 'Open File' dialog box is open, showing a file explorer with various folders and files, including 'BG.gif', 'BG2.GIF', 'bg20.GIF', and 'INOVANCE LOGO.GIF'. A yellow callout box with an arrow points to the 'INOVANCE LOGO.GIF' file, containing the text 'Click this to import the GIF'. Below the workspace, the 'GIF显示器\_6\_2\_2(GifDisplayItem)' properties panel is visible. It includes a 'General' tab with a 'Use original size of the picture' checkbox. A preview window shows the 'INOVANCE LOGO.gif' file. To the right, the 'Process' panel shows a dropdown menu set to 'Inlet\_Fan', with 'Value ON' set to '1' and 'Picture File' set to '<Undefined>'. A yellow callout box with an arrow points to the 'Inlet\_Fan' dropdown, containing the text 'A variable is needed to enable the GIF'. On the far right, a 'Simple Controls' sidebar lists various control types, with 'Gif Display View' highlighted in green.

## Switch

InoTouchPad provide 2 types switch to change the variable status.

### ➤ Text Switch: text to show the different status of a variable

The screenshot displays the InoTouchPad software interface. The main workspace shows a fan control interface with two fan icons labeled "Air Inlet" and "Air Outlet". Each fan has associated status fields for "Temp" (000000000 °C), "Humidity" (000000000 %RH), and a switch labeled "1#Switch" and "2#Switch" respectively, both currently set to "OFF".

The "Text Switch\_1(TextSwitch)" configuration window is open, showing the "General" tab. The "Text" section has "Text ON" set to "ON" and "Text OFF" set to "OFF". The "Process" section has "Tag" set to "Inlet\_Fan" and "Value ON" set to "1". A yellow box highlights the "Text ON" and "Text OFF" fields with the text "On/off text". Another yellow box highlights the "Tag" field with the text "Variable".

The "General" tab also includes checkboxes for "Switch" and "Click animate", and a "Hold Delay" set to "0 \*100ms".

The right sidebar shows the "Simple Controls" list, with "Text Switch" highlighted.

## Switch

### ➤ Graphic Switch : graphic to show the different status of a variable

The screenshot displays the Inovance software interface for configuring a Graphic Switch. The main workspace shows a preview of the switch graphic, which includes a red line graph, a green oval, and a circular gauge. The left sidebar contains a tree view with 'General', 'Properties', 'Animations', and 'Events' sections. The 'General' section is expanded, showing the 'Graphics' and 'Process' tabs. The 'Graphics' tab is active, displaying the 'Graphic ON' and 'Graphic OFF' settings, both set to '34.png' and '35.png' respectively. The 'Process' tab is also visible, showing the 'Tag' set to '<Undefined>' and 'Value ON' set to '1'. The right sidebar contains a list of controls, including 'Word Button', 'Simple Graphics View', 'Graphics View', 'Number IO Field', 'String IO Field', 'Date-Time Field', 'Graphic IO Field', 'Symbolic IO Field', 'Button', 'Text Switch', 'Graphic Switch', 'Timer', and 'Gif Display View'. The 'Graphic Switch' control is highlighted in the list.

On/off graphic

Variable

## Timer

Timer is a very useful control while users want to realize some certain function(s) in a certain screen. This control can map to system function or a customized script.

**\*Note:** a timer only works in current screen, if need a function works in whole project, scheduler could be a better choice(refer to script part)

The screenshot displays the InoVance HMI Designer interface. The main workspace shows a graphical representation of a timer control with a red waveform, a green oval, and a digital display showing '0000000000000000'. Below the display is a date-time field showing '2021-04-25 16:14:07'. The left sidebar contains a tree view with 'Timer\_1(TimerItem)' selected. The right sidebar lists various controls under 'Simple Controls', with 'Timer' highlighted. The bottom panel shows the 'General' settings for the timer, including 'interval' set to '10 \* 100ms', 'singleShot' checked, 'Tag' set to '<Undefined>', and 'Value ON' set to '1'.

## Timer

### Event:

Timer have only one event——Timeout. Users can configure this event with system built function or user script.

InoTouchPad provide below controls used to monitor/control process variable value.

**Bar:** used to monitor the process variable value

**Slider:** used to monitor/adjust the variable value

**Progress Bar:** used to display process scale values

**Round Progress Bar:** used to display process variable scale values

**Knob:** used to set the process variable value

**Gauge:** display the process variable value in format of analog type

**Meter:** display the process variable value in format of analog type

## ➤ Bar

The screenshot shows the INOVANCE software interface for configuring a 'Bar' instrument. The main workspace displays a bar chart with a cyan bar at 25.0% and a speed slider at 5.0. The right sidebar lists various controls, with 'Bar' highlighted. The bottom panel shows the 'General' properties for 'Bar\_1 (Bar)', including scale limits (Max 100, Min 0), process variable (MeterValue), and scale colors.

**Bar\_1 (Bar) General Properties:**

Scale

- Minor Scale Count: 5
- Decimal Digits: 0

## ➤ Slider

The screenshot displays the INOVANCE software interface. The main workspace shows a control panel with several instruments: a vertical level indicator on the left, a circular gauge showing 25.0%, a speedometer, a color-coded meter, and a motor icon. A slider control is positioned below the speedometer, with the label "Speed" and a value of 5.0. The slider has a range from 0 to 10. The right sidebar contains a "Tools" panel with various control elements, including "Slider", "Progress Bar", "Round Progress Bar", "Knob", "Gauge", "Meter", "3D-Pie", "QR code", "Bar Code", "CanvasItem", "FlowBlock", and "Alarm Bar". The bottom panel shows the "General" properties for the selected "Slider\_2(Slider)" object.

## ➤ Progress Bar

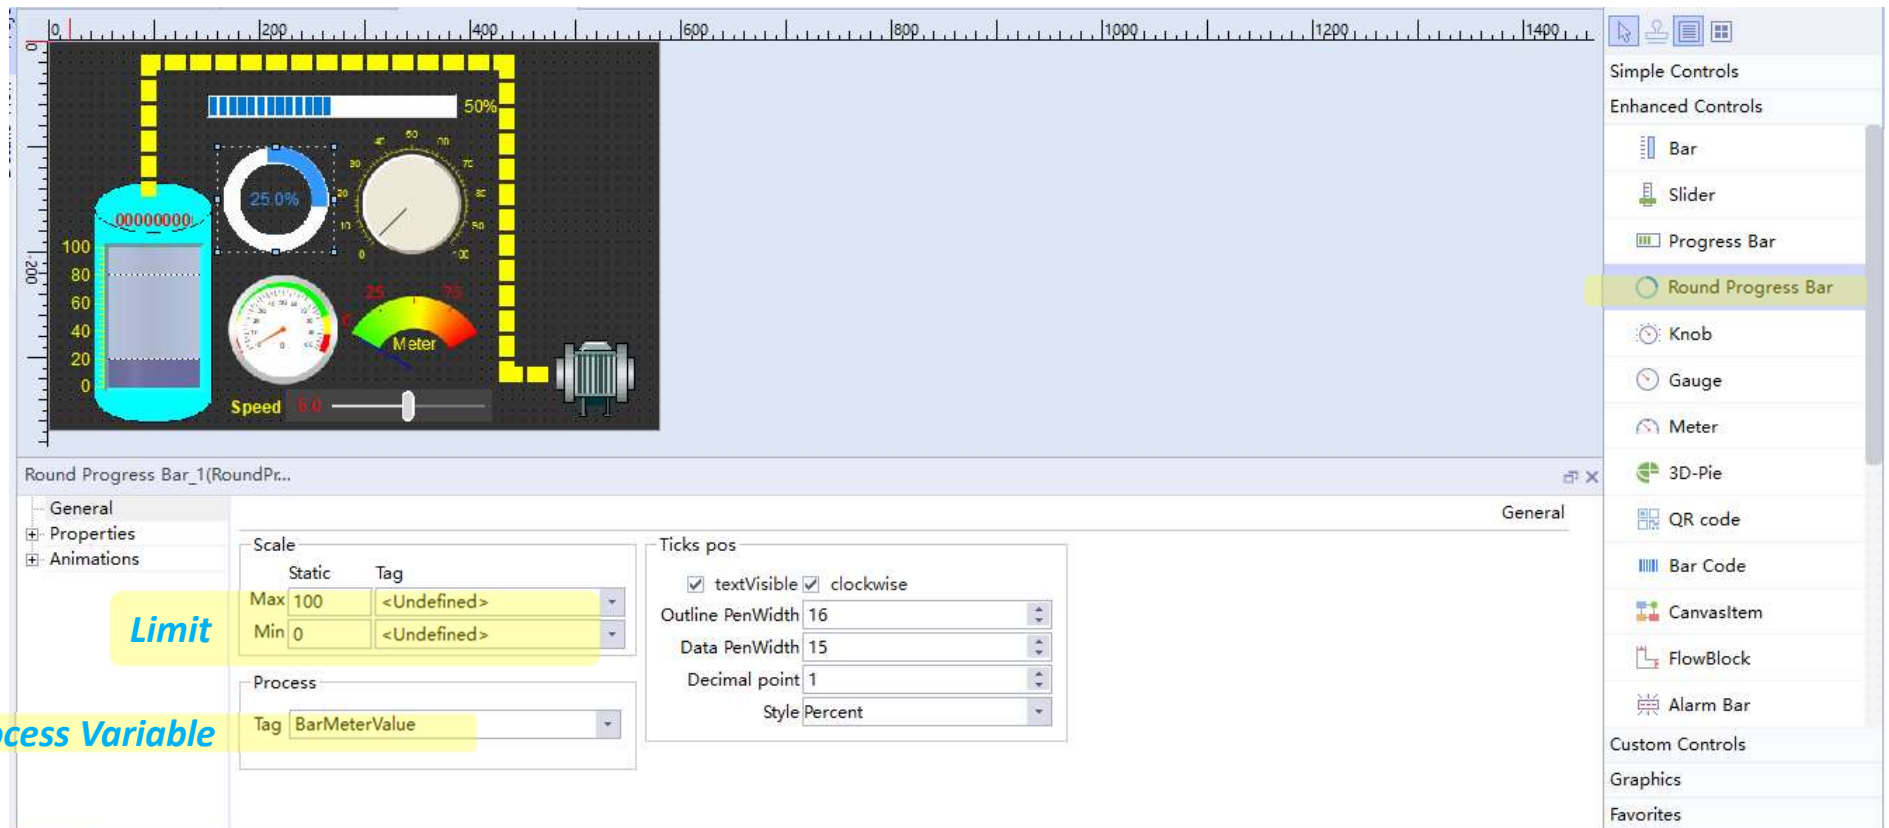

The screenshot displays the INOVANCE HMI software interface. The main workspace shows a black panel with various instruments: a cyan tank level indicator, a blue progress bar at 50%, a white gauge at 25.0%, a white speedometer, a green speedometer, a red 'Meter' with a needle, and a 'Speed 5.0' indicator. A yellow dashed line outlines the instruments. The right sidebar lists control types: Simple Controls, Enhanced Controls, Bar, Slider, Progress Bar (highlighted), Round Progress Bar, Knob, Gauge, Meter, 3D-Pie, QR code, Bar Code, CanvasItem, FlowBlock, Alarm Bar, Custom Controls, Graphics, and Favorites.

The configuration panel for 'Progress Bar\_1(ProgressBarItem)' is open, showing the 'General' tab. It includes a 'Limit' section with 'Max' set to 100 and 'Min' set to 0. The 'Process' section shows 'Tag' set to 'BarMeterValue'. The 'Ticks pos' section has 'textVisible' checked, 'inverted' unchecked, and 'Orientation' set to 'Horizontal'.

### ➤ Gauge

The screenshot displays the INOVANCE software interface for configuring a gauge. The main workspace shows a complex control panel with various instruments, including a digital display, a bar chart, a speedometer, a pressure gauge, a thermometer, and a motor. A yellow dashed line highlights a specific gauge component.

On the right side, a vertical toolbar lists various control elements. The 'Gauge' option is highlighted in yellow.

Below the workspace, the 'Gauge\_1(Gauge)' configuration panel is visible. It includes a 'General' tab with the following settings:

- General:** Label, Unit, Needle color (orange), Scale color (black).
- Fonts:** Title (Arial, 12), Digit (Arial, 12).
- Process:** Tag (BarMeterValue) - *Process Variable*

The 'Properties' section on the left lists: General, Appearance, Layout, Scale, Misc, Animations, Visibility, Events, and Change. The 'Scale' property is highlighted in yellow.

Below the 'Scale' property, the 'Range' settings are displayed:

Range	
minValue	0
lowError	10
lowWarning	20
highWarning	80
highError	90
maxValue	100

The 'Limit' label is placed below the range settings.

On the right side of the configuration panel, the 'Color' settings are visible:

- Color: (green)
- warningColor: (yellow)
- errorColor: (red)

The 'Display' section includes a checkbox for 'Display mark labels' which is checked.

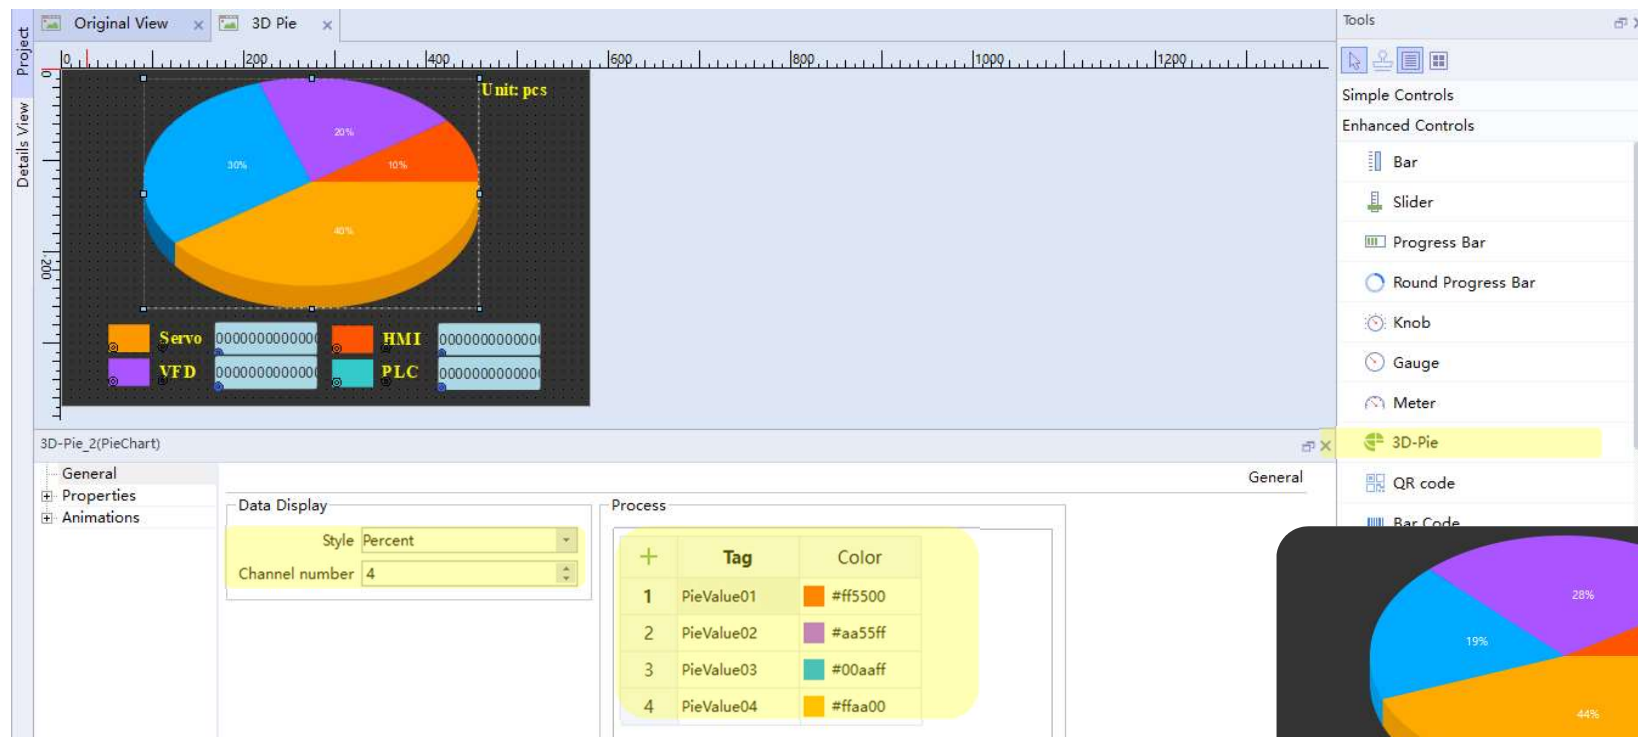

The page number '98' is located at the bottom right corner.

## 3D Pie

INOVANCE

**Level:** calibration level for QR code, 4 levels are available: L, M, Q, H. The higher the level, the higher the fault tolerance.  
**Tag:** read variable

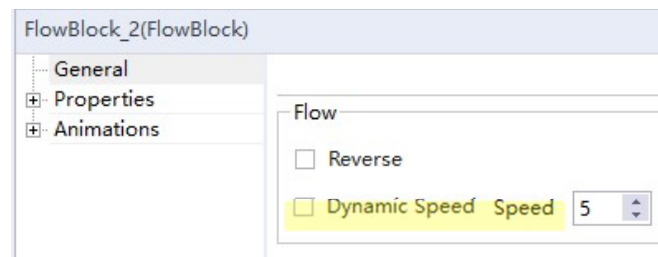

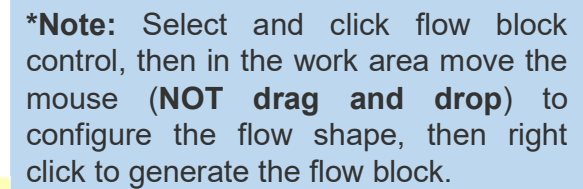

## Canvas Item

Canvas Item is used to display the graphics drawn by script.

Flow block is used to display of fluid flow dynamically.

Set flow speed as a fixed value or map to a variable to dynamically adjust.

## Alarm Bar

INOVANCE

[Back to Contents](#)

Alarm bar is used to display current alarm information. Users can select the display information and alarm class according to requirements.

The screenshot displays the INOVANCE software interface. The main window shows a 3D wireframe model of a mechanical part. On the right side, there is a vertical menu with various control options: Simple Controls, Enhanced Controls, Bar Code, CanvasItem, FlowBlock, Alarm Bar (highlighted), User View, and Trend View. Below the menu, a black alarm bar is visible with a speaker icon and the text: "Connection failure: Connection\_3, station 1.err:10001 2021-04-26 10:09".

At the bottom left, the 'Alarm Bar\_1(AlarmBar)' configuration panel is open. It has three tabs: General, Properties, and Animations. The 'Display' section is active, showing the following settings:

- Move Speed: 8 (labeled *Move speed*)
- Move Direction: ☒ From right to left, ☐ From left to right
- Alarm order: ☒ Time sequence, ☐ Time reversal
- Content: ☒ Time, ☒ Date, ☒ Message
- ☐ Auto Hide

Below these settings, there is a section for 'Alarm Class to display' with the following checked options:

- ☒ Errors
- ☒ Warnings
- ☒ System
- ☐ DeviceInfo

The label *Alarm display setting* is placed over the configuration panel, and *Alarm Class to display* is placed over the alarm class selection list.

## Alarm View

Alarm view is used to display current alarm information or historical alarm.

## User View

User view is used to manage the system authority and user logon/logout. For the authority setting please refer to 'User Administration'.

While HMI project running, click the empty part of user view, a login dialog box will pop up and users need select user and enter correct password to logon.

## Trend View

INOVANCE

[Back to Contents](#)

A trend view is used to display the change trend real time or historical variable value.

The screenshot displays the INOVANCE Trend View interface. At the top, a toolbar includes icons for home, settings, and help. Below the toolbar is a row of process tags: LW100, LW101, LW102, LW103, LW104, LW105, LW106, LW107, LW108, and LW109. The main area is a large empty chart with axes ranging from 0 to 100. A yellow callout box points to the chart area with the text: "Trend view support up to 8 trends, this process tag(bit 0~7) is used to control each trend display or not." Below the chart is a green button labeled "Click this button to change data value" and a row of 16 small square indicators. The bottom panel shows the "Trend View\_1(TrendView)" properties. The "General" tab is active, showing "Settings" (Number of lines: 1, Font: Arial,12, Button bar style: None, Rotate: 0) and "Elements" (Display value table: unchecked, Display ruler: checked, Display table grid: checked, Display mark labels: checked, Trend background transparent: unchecked). The "Process" section shows "Tag" set to "LW 110" with a hint: "Hint: the process tag 0-7 bit control the 1-8 trend visible, bit is 1 trend is visible, bit is 0 trend is invisible." The "ruler Tag" section shows "Position", "width", and "Move Enable" all set to "<Undefined>". A yellow callout box points to the "Display value table" checkbox with the text: "When 'Display value table' selected, 'Number of lines' works". On the right side, a "Tools" panel lists various controls: Simple Controls, Enhanced Controls, Bar Code, CanvasItem, FlowBlock, Alarm Bar, User View, Trend View (highlighted), XY Curve, Recipe View, Alarm View, Data View, Report View, Embed Screen, and OperationRecord. Below this is a "Custom Controls" section with "Graphics" and "Favorites" (106).

Trend view support up to 8 trends, this process tag(bit 0~7) is used to control each trend display or not.

When 'Display value table' selected, 'Number of lines' works

HorizontalScrollBar	AsNeeded
VerticalScrollBar	AsNeeded

*Process Tag: a variable to enable the embed screen*

The right sidebar contains a list of controls: Simple Controls, Enhanced Controls (CanvasItem, FlowBlock, Alarm Bar, User View, Trend View, XY Curve, Recipe View, Alarm View, Data View, Report View, **Embed Screen View**, OperationRecord View, FileBrowser View), Custom Controls, Graphics, and Favorites (115).

## Operation Record View

Operation record view can record the operation record for each controls running in HMI application and show the operation data/time and login user.

The screenshot displays the 'OperationLog' window and its configuration panels. The main window shows a table with columns: Username, ComponentName, Date, Time, and ActionDescription. Below the table, a message states: 'Select "Enable Operation Record" in "HMI Setting" --- "Project Setting"'. The configuration panels at the bottom are divided into two sections:

**Visible columns**

Column	Value
Username	90
ComponentName	150
Date	90
Time	90
ActionDescription	150

*Select displayed item*

**Sort**

☒ Time order  
☐ Time reverse order

*Sort mode*

The right-hand 'Tools' panel lists various controls, with 'OperationRecord View' highlighted. Other controls include Bar Code, CanvasItem, FlowBlock, Alarm Bar, User View, Trend View, XY Curve, Recipe View, Alarm View, Data View, Report View, and FileBrowser View.

## Operation Record View

Select start/end time and click 'Search' button to check the operation record.

\*Note1: need enable operation record in HMI setting. Refer to 'HMI Setting'.

\*Note2: need enable 'Operation Record' property for controls.

Start Time:	1-04-26 14:48:37	End Time:	1-04-26 16:48:37	Search

## File Browser View

File Browser view provide simple functionality to access external memory like SD card or USB.

The screenshot displays the File Browser View in a software interface. The main window shows a file browser with a list of files. A yellow highlight is on the 'File Path' property in the settings panel, with a blue arrow pointing to it and the text 'Save current selected file path'. The right sidebar shows a list of controls, with 'FileBrowser View' highlighted.

**File Browser View Interface:**

- Top Bar:** Contains 'Update', 'Mount device: Local', and 'FileName'.
- Main Area:** A large white rectangle representing the file browser.
- File Path:** A text field showing 'AAAAAAAAAAAAAAAAAAAAAAAAAAAA'.

## *InoTouchPad Common Operation*

### ➤ InoTouchPad

- The development software of IT7000 is **InoTouchPad**, and the installation package currently supports three installation languages: English + simplified Chinese + traditional Chinese. The USB download driver will automatically registered after installation (the software can be downloaded from INOVANCE website: [Link](#)).
- **InoTouchPad** supports Windows XP /Windows 2000 /Windows Vista/Windows 7/8/10 and other operating systems(32/64 bit).

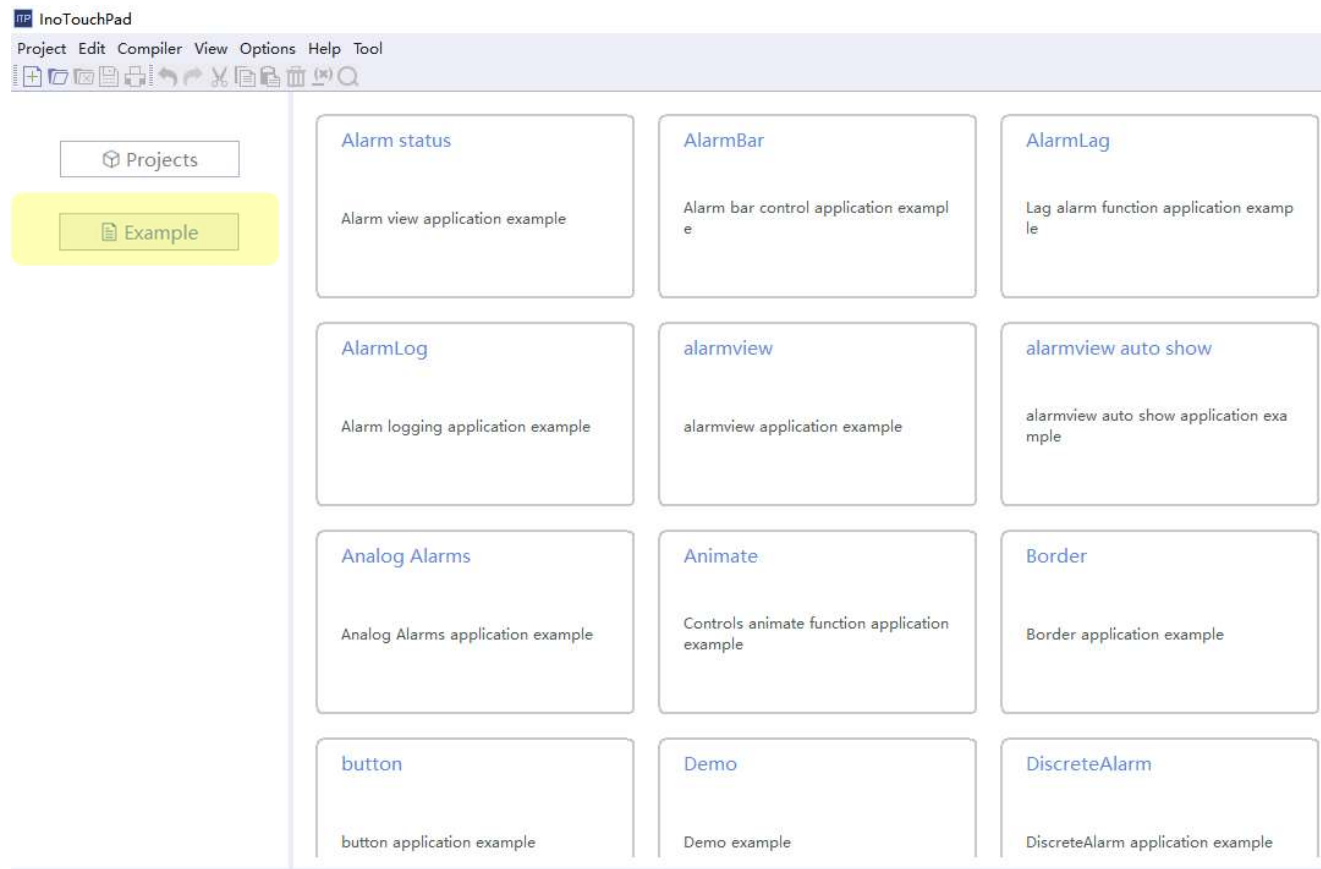

Language will be automatically selected according to the system language of PC.

**Installation steps**

## Example Project

While open the software, users can find the built in example projects, details show as below:

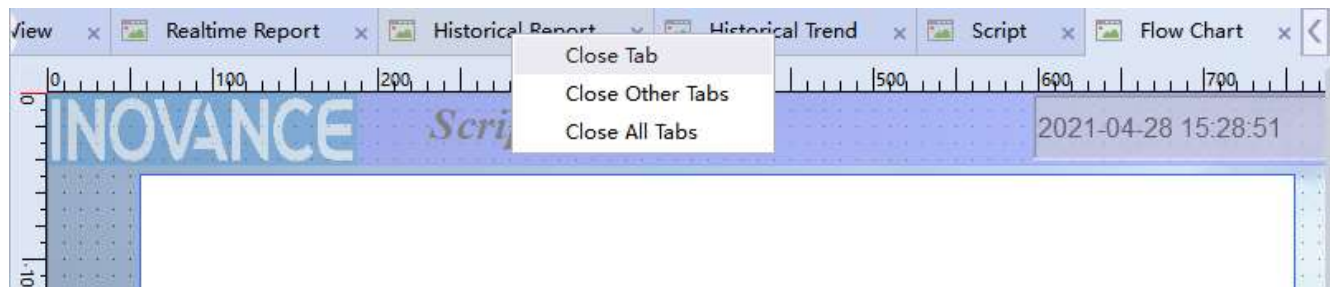

## Tab

InoTouchPad support up to 40 tabs in the UI development interface, sometimes when user open many tabs and it is inconvenient to exchange screen, they can try to right click and do the fast operation:

**Close Tab:** close current tab

**Close Other Tabs:** only remain current tab, other tabs will be closed

**Close All Tabs:** all the opened tabs will be closed

## Project Conversion

INOVANCE

[Back to Contents](#)

In the HMI settings view, users can change the device type to adapt to a specified model product, at the same time, they can adjust the display angle of the project, IT7000 HMI can display a project from 4 directions(0°, 90°, 180° and 270°).

## Table Operation

INOVANCE

[Back to Contents](#)

### ➤ Add/Delete row(s)

The icon  is used to add row(s). Click the lower right corner, there are 5 options: batch add size 1 as default, users can modify this setting to quickly add variable.

		Name ▾	Number ▾
1	✓	batch add size 1	
2		batch add size 2	
		batch add size 5	
3		batch add size 10	
		batch add size 20	

	Name ▾	Number ▾	Connection Id	Data type
1	RW 0	280	<Internal tag>	Int16
2	RW 1	281	<Internal tag>	Int16
3	RW 2	282	<Internal tag>	Int16

The icon  is used to delete row(s). While select a row or multi rows, this icon will appear.

\*Note: 'Del' key of PC keyboard can also used to delete a row.

Number>>Insert after the selected row, in this way users can insert a new item at an appropriate place.

		Name ▾	Number ▾	Connection Id	Data type
1		RW 0	280		
2		RW 1	281		
3		RW 2_1	314	<Internal tag>	Int16
4		RW 3	315	<Internal tag>	Int16
5		RW 2	313	<Internal tag>	Int16

✓ Insert after the selected row

Insert at the end

### ➤ Cross-References

Select a variable and right click, then click 'Cross-References', a reference table will be loaded. From this reference table, users can find where the selected variable is used, just click the item in this table, the corresponding screen/controls will load automatically.

	Name	Number	Connection Id	Data type	
1	LW 0		<Internal tag>	Int16	2
2	LW 1		<Internal tag>	Int16	2
3	LW 2		<Internal tag>	Int16	2
4	LW 3		<Internal tag>	Int16	
5	LW 4	5	<Internal tag>	Int16	

Cross-References for LW 0					
	Name	Property name	Path	Infotext	Comment
1	Number IO Fi...	Process value	Screens/Alarm	Alarm	
2	Error 1	Trigger tag	Alarm Management/...		
3	Script_14	Reference Obj...	Scripts/Script_14		

### ➤ Hide/Show Columns

InoTouchPad have many different tables used for different object. For example, for the object 'Tags', there are over 20 properties. But sometimes users don't want to show all properties in the table and they just need to show what they want. In this case, they just need to right click the title of the table and select the columns they want to hide/show.

+	Name	Number	Connection Id	Data type	Array count	Address	Acquisition cycle
1	LW 0	1	<Internal tag>	Int16		LW 0	100
2	LW 1	2	<Internal tag>	Int16		LW 1	100
3	LW 2	3	<Internal tag>	Int16		LW 2	100
4	LW 3	4	<Internal tag>	Int16		LW 3	100
5	LW 4	5	<Internal tag>	Int16		LW 4	100

## IT7000 & H5U simulation

IT7000 support simulation with inovance H5U series PLC without hardware connection. This functionality will help users to improve project development/commissioning efficiency.

### ➤ H5U

Software: AutoShop V4.2.0.0: [https://www.inovance.com/content/details86\\_19845.html](https://www.inovance.com/content/details86_19845.html)

Step1: Create a new project and compile all without error.

## ➤ H5U

Step2: Open the variable table and right click to export HMI variables. The export variable table should be .csv format.

The screenshot displays the H5U software interface. On the left, the Project Manager shows the hierarchy: H5U\_IT7000 [H5U] > System Variable Table > Global Variable > Structure > Element Table > Function Block Instances > Variable\_Table. The Variable\_Table is highlighted. In the center, a table lists variables with columns: NO., Variable..., Data Type, Initial Value, Power Down Hold, Comment, Element Addr., Length, and CurValue. The first row shows 'axMCPower\_...' with Data Type 'BOOL[31]' and Initial Value '...'. A context menu is open over the table, showing options like Cut, Copy, Paste, Select All, Delete, Insert row, Delete rows, Add Row, Bulk Add, Export, Import, and 'Export HMI Monitoring Variable Table(H)'. A red arrow points to the 'Export HMI Monitoring Variable Table(H)' option. A file explorer window is also visible, showing the file 'h5u variable.csv' selected in the 'Software' folder.

NO.	Variable...	Data Type	Initial Value	Power Down Hold	Comment	Element Addr.	Length	CurValue
1	axMCPower_...	BOOL[31]	...	Non Retained			nRitLen: 31	

## ➤ IT7000

**Step1: Add a new connection, select 'H5U TCP Monitoring Protocol' and set the slave device IP address as 127.0.0.1.**

The screenshot displays the Inovance software interface with the following components:

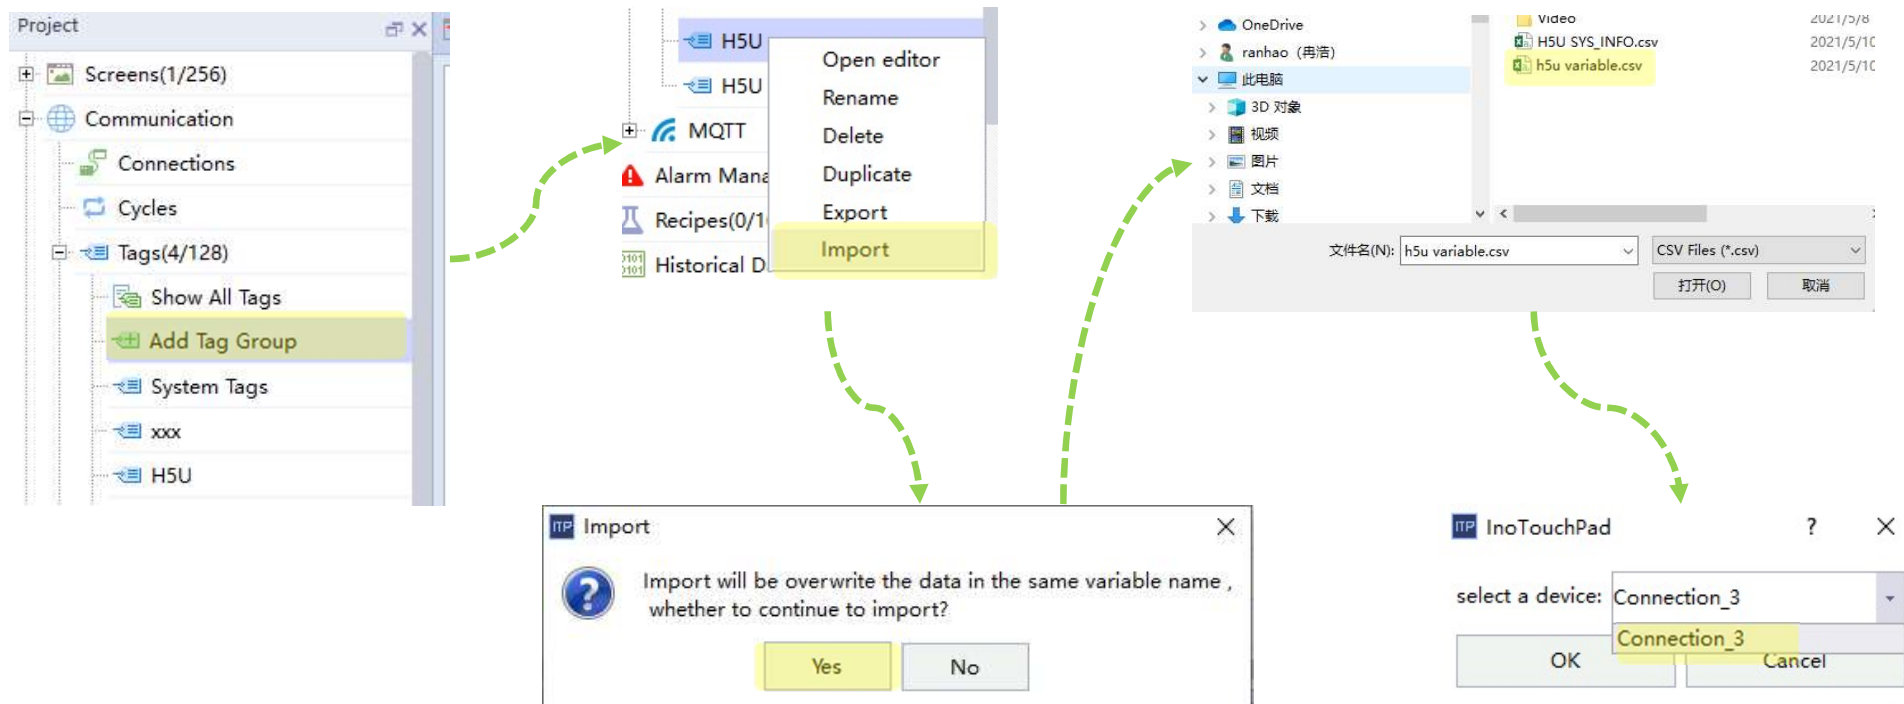

- Left Panel (Navigation Tree):**
  - Screens(1/256)

## ➤ IT7000

Step2: Add a new tag group, select and right click to import variables.

### ➤ IT7000

#### Step3: Configure/or map H5U variable to HMI controls

The screenshot displays the IT7000 HMI simulation interface. At the top, there are two main control panels: **MC\_Power** and **MC\_Jog**. The **MC\_Power** panel includes a large 'OFF' button, an 'Enable' button, and a status table with 'Status', 'Busy', 'Error', and 'ErrorID' (0000). The **MC\_Jog** panel includes 'OFF' buttons, 'Enable', 'JogFWD', 'Busy', and 'CmdAbort' buttons. Below these panels, a configuration window for 'Button\_1(BitButton)' is open, showing the 'General' tab. The 'Read' section has 'Read Tag' set to 'axMCPower\_Enable[0]' and 'Output Reverse' unchecked. The 'Write' section has 'Read/Write Tag Same' checked and 'Mode' set to 'Invert'.

Constant password: while using constant password, the instalment password and time is certain value(s)

Step1> double click the tab\* to modify customer name

The screenshot shows the IT7000 interface with tabs 'tab\_1' and 'tab\_2'. A dialog box titled 'Input Name' is open, with the 'Name' field containing 'User1'. The dialog has 'OK' and 'Cancel' buttons. In the background, the 'Admin password' field is visible, and a 'batch' button is present. Below the dialog, there is a table with columns: Name, Password, and Comment.

The screenshot shows the IT7000 interface with tabs 'User1' and 'tab\_2'. The 'Admin password' field is visible, and the 'batch' button is present. A dropdown menu is open next to the 'batch' button, showing the option 'Use Constant Password' selected. Below the dropdown, there is a table with columns: Name, Id, DateTime, Password, and Comment.

Step2> select <Use Constant Password>

The screenshot shows the IT7000 interface with tabs 'User1' and 'tab\_2'. The 'Admin password' field is visible, and the 'batch' button is present. A dropdown menu is open next to the 'batch' button, showing the option 'Use Constant Password' selected. Below the dropdown, there is a table with columns: Name, Id, DateTime, Password, and Comment.

## ➤ Constant Password

Step3> Create new instalment stage information by click <+> icon. Users can set the <Admin password> in this page. At the same time, for each stage, the <DateTime> and <Password> can be set separately.

Admin password

batch

Use Constant Password

+ ▼	Name	▲ Id	DateTime	Password ▼	Comment
1	Stage1	1	2021-11-03 0...	*****	Please enter ...
2	Stage2	2	2021-11-04 0...	*****	Please enter ...
3	Stage3	3	2021-11-05 0...	*****	Please enter ...
4	Stage4	4	2021-11-06 0...	*****	Please enter ...

## ➤ Variable Password

Variable password: The date time and password can be set as variable

Step1> double click the tab\* to add a new user, and select the <Use Variable Password>

☐ enable **AddCustomer** **1** **DeleteCustomer** **DynamicUnlock**

## ➤ Variable Password

## Step2&gt; Add instalment stage

+	Name	Id	DateTime	Password	Comment
1	Stage1	4	<Undefined>	<Undefined>	Please enter password to unlock system
2	Stage2	5	<Undefined>	<Undefined>	Please enter password to unlock system
3	Stage3	6	<Undefined>	<Undefined>	Please enter password to unlock system
4	Stage4	7	<Undefined>	<Undefined>	Please enter password to unlock system

## Step3&gt; Create variable in tag group and set the initial value for these variables.

+	Name	Number	Connection Id	Data type	Length	Array count	Address	Start value	Index Tag
1	DT1	1	<Internal tag>	DateTime	8	1	LW 0	2021-11-03 14:15:24	<Undefined>
2	DT2	2	<Internal tag>	DateTime	8	1	LW 10	2021-11-04 14:15:26	<Undefined>
3	DT3	3	<Internal tag>	DateTime	8	1	LW 20	2021-11-09 14:15:29	<Undefined>
4	DT4	4	<Internal tag>	DateTime	8	1	LW 30	2021-11-11 14:17:57	<Undefined>
5	PSW1	5	<Internal tag>	String	10	1	LW 40	psw1	<Undefined>
6	PSW2	6	<Internal tag>	String	10	1	LW 50	psw2	<Undefined>
7	PSW3	7	<Internal tag>	String	10	1	LW 60	psw3	<Undefined>
8	PSW4	8	<Internal tag>	String	10	1	LW 70	psw4	<Undefined>

## ➤ Variable Password

Step4> Map these variables to <DateTime> and <Password>

+	Name	Id	DateTime	Password	Comment
1	Stage1	4	DT1	PSW1	Please enter password to unlock system
2	Stage2	5	DT2	PSW2	Please enter password to unlock system
3	Stage3	6	DT3	PSW3	Please enter password to unlock system
4	Stage4	7	DT4	PSW4	Please enter password to unlock system

### Take note:

The difference between variable password and constant password is:

While using constant password, the stage time and password cannot be modified and once the stage passed, it cannot be enabled again. But while using variable password, even though one stage is passed, users can modify the date time and password (**have to modify password, or the stage will not work!**) to reuse this stage. For example, in a 4 stages instalment project, the first stage original date value is 2021/10/01, but users want to reuse the stage in 2021/10/08, then they can modify the corresponding variable for data time and password to re-enabled the first stage. **However, if all stages passed(which means all instalments unlocked), this operation will not work, and the instalment cannot be re-enabled.**

## ➤ Dynamic Password

Dynamic password: similar with variable password, but only need to configure the data time  
The configuration steps please refer to variable password.

Take note: the <Dynamic Check Password> used to generate the dynamic password

User1 User2 User3

Admin password

batch Use Dynamic Password Dynamic Check Password

	Name	Id	DateTime	Password	Comment
1	Stage1	1	DT1	**	Please enter password to unlock sys...
2	Stage2	2	DT2	**	Please enter password to unlock sys...
3	Stage3	3	DT3	**	Please enter password to unlock sys...
4	Stage4	4	DT4	**	Please enter password to unlock sys...

### ➤ Dynamic Password

While the HMI up to instalment stage, below screen will show in HMI and generate the random code:

## ➤ Dynamic Password

Click <DynamicUnlock>, then a <DynamicPasswordGenerator> tool will pop up. Enter the <Dynamic Check Password> and <RandomCode>

The screenshot shows the main application window and a pop-up 'DynamicPasswordGenerator' dialog. The main window has a 'DynamicUnlock' button (1) and a 'Dynamic Check Password' field (2). The pop-up dialog has a 'Please Input RandomCode:' field (3) and a 'Check' button (4). Below the 'Check' button, there are fields for 'MachineType', 'Delay' (5: If need delay the instalment time), 'DelyaDay' (6: Delay days), and 'Method'. At the bottom of the pop-up is a 'PassWordGenerate' button (7).

### ➤ Customized Unlock Dialog

The effect of customized unlock dialog show as below.  
Take note, customized unlock dialog is not available for dynamic password mode.

A screenshot of a customized unlock dialog box. The dialog has a blue title bar with a close button (X) in the top right corner. The main area is light gray and contains three input fields stacked vertically. The first field is labeled 'Date Time' and contains the text '2021-11-0'. The second field is labeled 'Instal Stage' and contains the text 'Stage1'. The third field is labeled 'Password' and is empty. At the bottom right of the dialog is a button labeled 'Unlock'.

### ➤ Admin Password

Admin password have the highest authority, users can enter the admin password to unlock current instalment or unlock all instalment.

tab\_1

Admin password

0

*Unlock current instalment*

*Unlock all instalments*

## ➤ Trigger instalment in advance

Control event bind to system function <TrigInstalmentEarly> to trigger the instalment in advance, select system variable <\$InstalmentLockTrigger> as the trigger tag. While corresponding control event triggered, the next instalment will be triggered in advance.

The screenshot shows a configuration window with a 'Function List' on the left and a configuration table on the right. The 'Function List' contains several functions, with 'TrigInstalmentEarly' highlighted. A yellow callout 'Select the function' points to this entry. The configuration table has three columns: a plus sign, 'Name', and 'Number'. It lists three system variables, with '\$InstalmentLockTrigger' highlighted. A yellow callout 'Select system variable' points to this entry.

	Name	Number
1	\$InstalmentLockState	6
2	\$InstalmentLockRemainTime	7
3	\$InstalmentLockTrigger	8

### ➤ Remaining time to next instalment stage

System variable <\$InstalMentLockRemainTime> used to show the remaining time to next instalment stage, the unit is minute.

+	Name	▲ Number ▼
1	\$InstalMentLockState	6
2	\$InstalMentLockRemainTime	7
3	\$InstalMentLockTrigger	8

### ➤ Retain Instalment

While download the project, select <Retain InstalMent> to retain the instalment information, which means the unlocked instalment will not be triggered again even though users download the new project into the HMI. If this option unchecked, all instalment information will be updated.

## IT7000 Variable Index

INOVANCE

[Back to Contents](#)

IT7000 provide 128 16-bit index registers and 128 32-bit index registers, users can do address operation by configure index registers. This function support to access different register address with only 1 control. The steps to use variable index show as below:

**Step1: Add the index tag in <System Tags>**

	Name	Number	Connection Id	Data type	Length	Array count	Address
1	\$InstalMentLockState	6	<Internal tag>	Int16	2	1	LW 95
2	\$InstalMentLockRemainTime	7	<Internal tag>	Int32	4	1	LW 95
3	\$InstalMentLockTrigger	8	<Internal tag>	Bool	1	1	LB 95
4	\$INDEX_128	9	<Internal tag>	Int32	4	1	LW 97
5	\$INDEX_129	10	<Internal tag>	Int32	4	1	LW 97

The screenshot shows the IT7000 software interface. On the left, a tree view under 'Communication' shows 'Tags(3/128)' expanded, with 'System Tags' selected. The main area displays a table of tags with columns: Name, Number, Connection Id, Data type, Length, Array count, and Address. Rows 4 and 5 are highlighted in yellow, showing '\$INDEX\_128' and '\$INDEX\_129' respectively. On the right, another tree view shows 'Index Tag' expanded, with '32 Bit' selected, and '\$INDEX\_128' and '\$INDEX\_129' listed below it, with '\$INDEX\_129' highlighted in blue.

## IT7000 Variable Index

**Step2: Using (or bind) index variable, there are 2 method:**  
>in variable table column <Index Tag> to add the index variable  
>manually add the index variable while configuring the control's address

	Name ▾	Number ▾	Connection Id	Data type	Length	Array count	Address ▾	Start value	Index Tag
1	LW 0	11	<Internal tag>	Int16	2	1	LW 0		\$INDEX_128

## USB disk or SD card Operation

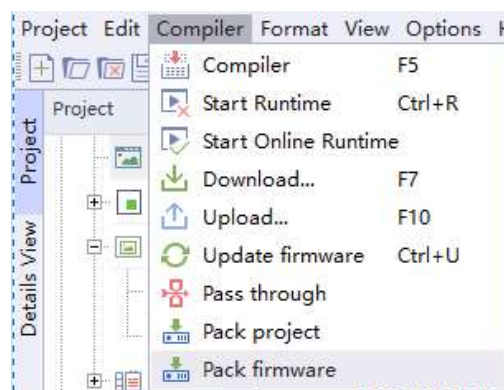

INOVANCE

[Back to Contents](#)

Besides export/import data by external device(USB or SD card), IT7000 also support update HMI program/firmware and PLC program by using USB disk or SD card.

### ➤ Upgrade HMI program/firmware by SD/USB

Step1: Select <Compiler> → <Pack firmware> to pack the firmware (<Pack project> to pack the project), select the target location(or save path), then click Ok to continue.

## USB disk or SD card Operation

### ➤ Upgrade HMI program/firmware by SD/USB

**Step2:** Copy the firmware/or project into SD card/USB disk, then insert the SD card/USB disk to HMI, get into the control panel of HMI, select the firmware or project, then click <HMI Pro.> to upgrade program or firmware.

名称	修改日期	类型	大小
 firmware.zip	2021/11/4 14:42	zip Archive	13,801 KB

### ➤ Upgrade underlying software(kernel) with SD

1. Prepare a SD(TF) card, recommend the memory storage not over 32G.

2. Insert the SD card to a SD card reader and insert the SD card reader to PC USB port.

3. Double click to open the SD card tool. Users can get this tool from the local inovance representative office.

### ➤ Upgrade firmware with SD

4. Select the SD card, and execute the format command

5. Copy the kernel files to the root directive of the SD card

## USB disk or SD card Operation

INOVANCE

[Back to Contents](#)

### ➤ Upgrade firmware with SD

6. Open the back cover of IT7000, and insert the SD card with kernel

2: to use a screw driver or a jumper cap to short connect:  
IT7070: CN4  
IT7100/7150: CN3

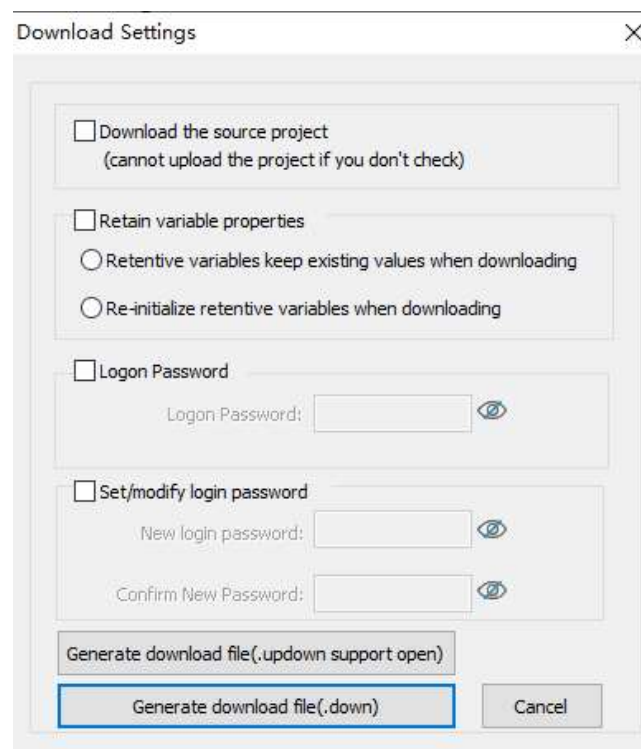

1: insert the SD card

3: keep the CN4(or CN3) in short circuit status, and power on the HMI until the buzzer sound, after that, HMI start to upgrade kernel and users can remove the screw driver or jumper cap. Waiting about 1 min, the buzzer will sound again with longer time, which means that the kernel upgrade done. Then unplug the SD card and repower the HMI.

### ➤ Upgrade PLC program by SD/USB

**Step1:** Open the PLC project in AutoShop, select <File> → <Generate Download File>, in the pop up dialog, set the download file properties, then click <Generate download file> to generate a .down file or .updown file.

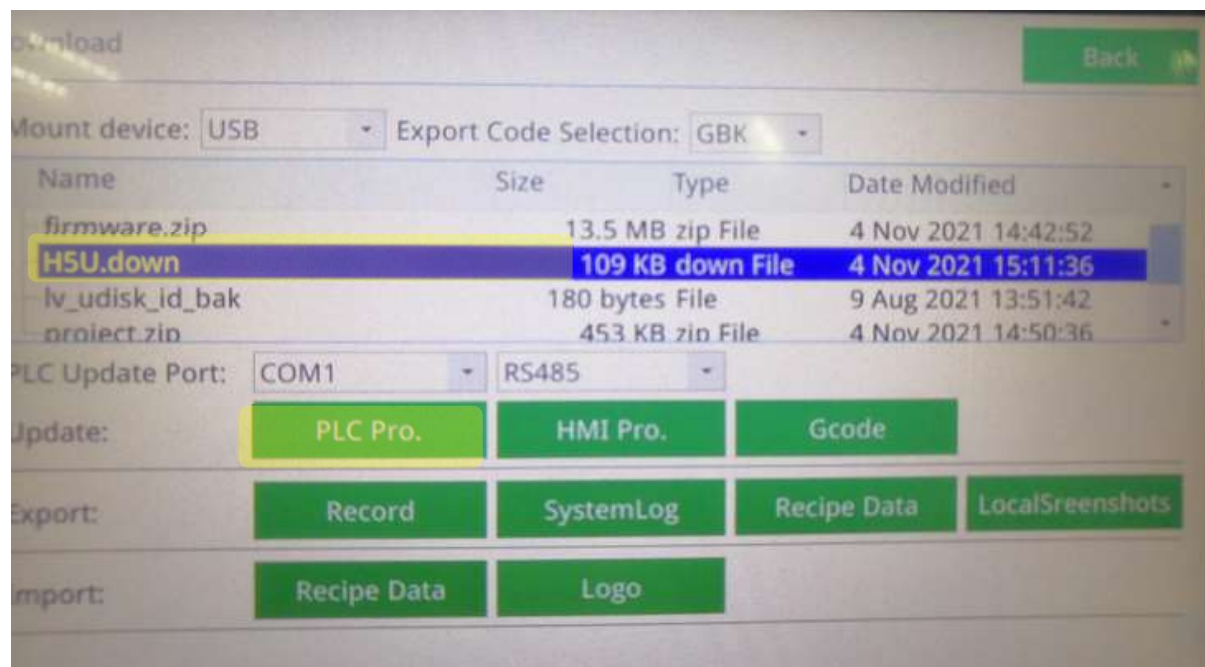

## USB disk or SD card Operation

### ➤ Upgrade PLC program by SD/USB

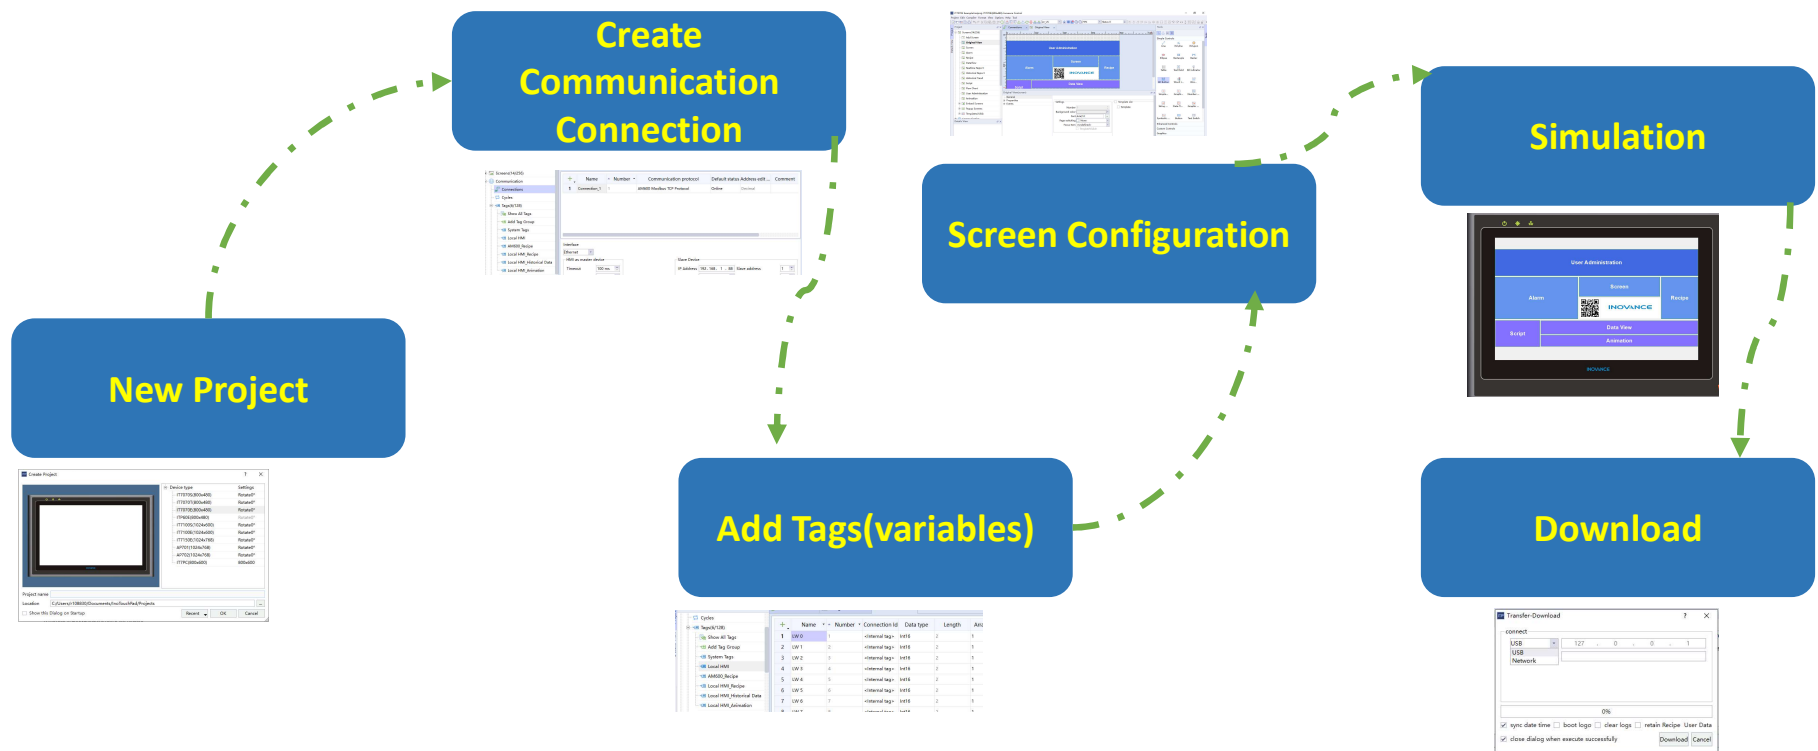

Step2: Copy the download file to SD card/or USB disk, then insert the SD card/USB disk to HMI, get into the control panel of HMI, select the download file, then click <PLC Pro.> to upgrade PLC program.

\*Take note: The PLC need connect to HMI
